This Scotch word souter preserves the old Latin word *sutor*—"Ne sutor ultra crepidam"—(Let not the shoemaker go beyond his last), as Apelles the painter said to the

cobbler, who, after finding fault with the sandals of the figure in the picture, presumed to extend his criticism to other portions of which he was not qualified to judge. The word "souter" is familiar to us from Burns's Souter Johnny—whose real name was John Lauchlin, shoemaker of Ayr—and from Scott's Wat Tinlin, "sutor and archer," in the "Lay of the Last Minstrel." *Cordiner* was another word also used in Scotland for a shoemaker, brought from France in the Quentin Durward days, and borrowed from the French *cordinier* or *cordonnier*. The chief seat of the manufactory of that famous Spanish leather for shoes, of which the author of "Hudibras" speaks in a humorous couplet, was Cordova or Cordua, which gave the name not only to *cordonnier*, but also to *corduainier*, which soon became Anglicised to cordwainer; and, so early as 1410, "The Cordwainers and Cobblers' Company" was incorporated by letters patent. The second title has fallen into contempt, and the Company, which has a fine hall in Great Distaff Lane, St. Paul's, is now known only by its first name. But, in Flanders, the cobblers take the precedence of the shoemakers in all processions and on all public occasions; and their famous "Company of Cobblers" bear for their heraldic designation a boot surmounted by an imperial crown: even as the Baron of Bradwardine was permitted to add to his paternal coat-of-arms, "a budget or boot-jack, disposed salter-wise," in consideration of the knightly service he had yielded to his royal master in undoing the latchet of his brogue. The Flanders cobblers gained their arms and their precedence over the shoemakers from a freak of their Emperor Charles v, who, in one of his Haroud Alraschid rambles through the city, went, on the evening of October 25th, to a cobbler's stall to get his boot mended, and found the cobbler carousing with his friends in honour of its being St. Crispin's day. The cobbler flatly refused to mend the visitor's shoe, and declared he would not do a stroke of work on Crispin's day, even for the emperor himself. "Do you love him?" asked the visitor, as he sat and drank with them. "Aye! we love his long-noseship well enough," replied the cobbler; "but we should love him more if he would tax us less." On the morrow, the cobbler was summoned to the palace, where, to his confusion, he recognised his visitor of the previous evening in the person of the emperor; who, however, received him very graciously, and told him he would grant him any request that he made. The simple-minded man scratched his head and could think of nothing more than that his Company of Cobblers should bear an imperial crown on their coat-of-arms. The emperor granted this request and bade him make a second. The man asked for a day to think over the matter, and then pleaded that the Company of Cobblers might take precedence over the Company of Shoemakers, which request was also granted. A somewhat similar story is told of our own King Henry VIII, though, in the English instance, the honest cobbler is raised to be a king's courtier, pensioned with forty marks a year, and given the freedom of the cellar.

A newspaper paragraph, in July, 1863, gave us the following information in connection with the ungentle quarrels among the foreign members of the gentle craft:—

"The regular shoemakers and irregular cobblers of Frankfort are at war with the most determined virulence. Ever since the days of Charlemagne the bootmakers claim an exclusive right over the upper leathers of shoes and boots, whilst to the cobblers, under certain circumstances, are yielded all connected with the soles. The shoemakers now claim the right of the doctorship of

the seams of boots, whether old or new. The cobblers deny this, and demand the complete monopoly of all boots that require repair, whether in the sole or the upper leather. The 'Nouvelle Gazette de Frankfort' states that the civic authorities, wishing to put a stop to the unseemly warfare, appointed one of the Professors of the School of Chemistry as arbitrator between the contending interests. He has given his judgment in favour of the bootmakers, considering that new seaming comes under their department. The cobblers resist the decree, and insist upon it that a chemist is not the proper person to form a judgment."

I am not aware how the dispute was ended: perhaps it still remains unsettled. But the cobblers of Hanover took precedence over the shoemakers, and, in October, 1861, a newspaper correspondent from Berlin wrote as follows:—

"The King of Hanover has just been received into the corporation of cobblers, the most ancient in the kingdom. His son has also been received. The custom of great personages getting admitted into trades corporations is not of German origin, but has been imported from England, and excites much merriment here."

But, despite the examples from Flanders, Hanover, and elsewhere, cobbler is a word that has not a high standing in England; and Pope could speak of a man who, "cobbler-like," and after the fashion of "the apron'd cobbler," became disgustingly tipsy. His oft-quoted couplet follows upon this:—

"Worth makes the man, and want of it the fellow,
The rest is all but leather and prunello."

The members of the gentle craft are known by other names than those of cobblers, shoemakers, and cordwainers. There are the welters, repairers, blockers, clickers, cleaners, closers, clobberers, and runners. There are also the snobs, who work with snobs' tools, though the etymology of these words has, up to the present, defied the deepest researches of the ingenious correspondents of "Notes and Queries." There are also the translators, who surpass Aladdin and his lamps, for they make new boots out of old ones: and there are also the slobberers, to which epithet tradition ascribes a great antiquity.

James Lackington, who had been a shoemaker before he became bookseller, poet, and proprietor of "The Temple of the Muses," wrote this couplet:—

"Cobblers from Crispin boast their public spirit,
And all are upright, downright men of merit."

There were certainly many men of merit and mark who were at some period of their career members of the gentle craft; and, in St. Crispin's month, I may fitly conclude this October essay by putting my readers in mind of various notable persons who have been sons of Crispin. The gentle craft's list of poets would include Richard Savage, Bloomfield and his brother Nathaniel, and other "tuneful cobblers," who, as Byron said, could "compose at once a slipper and a song;" men like Blackett, who "St. Crispin quits and cobbles for the muse," under the patronage of Capel Loft, who was thence dubbed "the Mæcenas of shoemakers." Horace's cobbler (in his third satire), and Lucian's cobbler, Micyllus, must not be forgotten; nor Gay's lines in his "Trivia," nor Cowper's playful verses written on the heel of a shoe. The poet Coleridge wished to apprentice himself to a shoemaker, but was prevented from doing so by Bowyer, the head master of Christ's Hospital. Of minor poets who were shoemakers I have gathered the names of John Bennet, of Woodstock; Nathaniel

Elliott, of St. Ebb's Lane, Oxford; J. R. Withers, of Fordham; John Foster, of Winteringham; Edmund Gill, of York; Charles Crocker, the verger of Chichester; John Strothers, and James Woodhouse, to meet whom Dr. Johnson received his first invitation to the Thrales. Sir Cloudesley Shovel, Sir William Read, Dr. Grant, and Fournier, had all belonged to the gentle craft; so had Gifford, the famous editor of the "Quarterly," a fact not forgotten by Peter Pindar in his "Cut at a Cobbler." James Dowie, like Deulin, cannot only make shoes, but writes ably on "The Foot and its Covering." Gavin Wilson, Thomas Holcroft, Hardy, the radical, and Sir Simon Eyre, Lord Mayor of London, were all shoemakers. So were the learned Benedict Baudoin, John Partridge, the astrologer; Sibley, the Swedenborgian; Jacob Boehmen, the Teutonic philosopher; Samuel Drew, the metaphysician; Bradburn, the famous Methodist preacher; George Fox, the founder of the Quakers, together with his follower, Thomas Shillito. William Huntingdon, the celebrated preacher of Providence Chapel, Gray's Inn Lane, delighted to style himself "coal-heaver and cobbler;" and Orator Henley crowded his chapel by advertising that he would show his hearers how to make a shoe in less than five minutes: which he did by taking a boot and cutting off its foot. He called this "exercising their faith."

Although Linnæus was not a shoemaker, yet he was intended for one. Porson's mother was a shoemaker's daughter; and Winckelmann, the writer on the fine arts, and David Roberts, the painter, were shoemakers' sons. Pittman, the Birmingham artist and animal painter, was not only a shoemaker's son, but was brought up to his father's trade. The great George Stephenson made and mended shoes and made shoelasts after the ordinary labour of the day was done, in order that he might be able to procure for his son Robert that education of which he himself was deficient. In a letter written by Marshal Vaillant, November, 1866, that gallant French soldier says of his family: "My grandfather kept a little silk-mercier's shop at Dijon. His father had been a shoemaker. I cannot go further back: my quarters of nobility stop with the shoemaker." The reverse of this has been occasionally seen; for Sir Bernard Burke, in his "Vicissitudes of Families," says that "as late as 1837 the great-grandson of Margaret Plantagenet, herself daughter and heir of George, Duke of Clarence, was following the cobbler's craft at Newport, in Shropshire." The great-granddaughter of Oliver Cromwell sank to be a shoemaker's wife; and the last of the Juxons is now represented by a shoemaker. For a full account of the leading part acted by the fortunate shoemaker, M. Zamet, in that drama of intrigue which was so popular in the court of *Le Grand*, I must refer my readers to Miss Freer's "Henry IV and Marie de Medici" (vol. II, pp. 81—91).

John Pounds, the Portsmouth cobbler, should have his name written in letters of gold in the lists of members of the gentle craft: for he may be called the founder of ragged schools. Alderman Drummond, of Dublin, who received a public funeral in March, 1862, and left the sum of £20,000 to found a military orphan school, had commenced life as a working bootmaker. But, to save space, I must restrict myself to a bare mention of other famous members of the gentle craft. William Sturgeon, Professor of Natural Philosophy in the Military Academy at Addiscombe; David Pareus, Professor of Theology at Heidelberg; Ralph Finlay, the entomologist; William Parsons, the mathematician and surveyor-general, of Philadelphia; Horton Bentley, the

builder-up of the skeleton elephant in the Manchester museum; Benjamin Satchwell, the discoverer of the saline springs at Leamington; John Younger, of St. Boswell's, author of "River Angling for Salmon and Trout;" S. A. Mackay, of Norwich, author of "Mythological Astronomy of the Ancients;" and John Brand, Secretary of the Antiquarian Society of London, and author of several learned works—had all, at one period of their lives, been shoemakers. So had Hans Christian Andersen, the celebrated Danish writer; and Hans Sach, of Nuremberg, the poet and friend of Luther; while of those members of the gentle craft who have preached the gentle words, "Peace on earth, goodwill to all men," I may mention the illustrious missionaries, Dr. Carey, Dr. Morrison, and Dr. Ebenezer Henderson, Dr. Marshman, the Rev. John Thorpe, of Masbro', and Dr. John Kitto, to whose biblical illustrations and researches every student of the Holy Scriptures is deeply indebted.

Among living members of the craft I may name Mr. John Kelso Hunter, shoemaker and portrait painter, known in his native Ayrshire and throughout the Western Highlands of Scotland by the familiar name of "Tammis Turnip." Mr. Hunter has now extended the circle of his admirers by the publication of his autobiography, entitled "The Retrospect of an Artist's Life: Memorials of West Country Men and Manners of the Past Half Century."

Another more notable name is that of Mr. Thomas Cooper, shoemaker, schoolmaster, newspaper reporter and editor, Chartist leader, political prisoner, infidel lecturer, poet and novelist, and Baptist preacher. His death was reported last May, but after a few days' interval, letters appeared in the newspapers from Mr. Thomas Cooper himself, to say that he was still alive and well. His career affords a remarkable example of that diligent pursuit of literature and cultivation of thought which has often been found in connection with the shoemaker's bench, and of which I have already adduced many instances. It has been recorded of Mr. Thomas Cooper that, born in 1805, "he was taught the humble trade of a shoemaker in his youth, and, having instructed himself in the Latin, Greek, Hebrew, and French languages while at his stall, became a schoolmaster at twenty-three." It was while in prison that he wrote his poem on "The Purgatory of Suicides."

I will conclude this paper with a peep at a member of the gentle craft given by Luther in his "Table-talk," and it is a happy illustration of religion in common life. "Anthony the Hermit was told in a dream," says Luther, "that there was a shoemaker in Alexandria who was to be the sharer of his immortal glory. Anthony was astonished, and hastened to Alexandria to see him; for he thought that the shoemaker must be a most excellent and highly-gifted man, to be fit for his company in heaven. When he came to him, he found him at his work, by which he supported his family, and said to him: 'My friend, I know that you serve God faithfully—I pray you, tell me what you do, what you eat, what you drink, how or when do you pray? Are you in the habit of watching and praying all night?' 'By no means,' said the shoemaker; 'but morning and evening I thank God for his gracious protection; and I pray that he will forgive all my sins, for Christ's sake; then I pray that he would continue to guide me by his Holy Spirit, and not give me up to temptation. When I have offered my prayers, I again go diligently to my leather, and work for the support of my family; beyond this I do nothing, except to take care that I do nothing against my conscience.'"

Poetry.

THE WATCHER AND HIS ANSWER.

"Oh watcher on the walls of life beyond the dimness and the dream,
Look forth upon the mighty world, its field and forest, town and stream;
And as we hearken sunder sure the things that are from things that seem."

"I see a smiling phantom pass, which jostling crowds pursue
amain,
They call her Pleasure, and they catch the radiant fringes of her train;
But evermore she melts in air, and every hand is closed in vain."

"What more, oh watcher?" "Now I see red War tramp forth—he drips with gore;
Great navies ride upon the sea, and armies gather on the shore;
And women's shrieks and children's cries are mingled with the cannon's roar."

"What more, oh watcher?" "Famine comes; all ghastly grey he takes his stand,
And mildew, blight, and canker fall, dark poison droppings from his hand;
The grapes are withered on the vine, the corn crops rot along the land."

"What more, oh watcher?" "Stalking slow I see the black-robed Pestilence;
He treads the squares, the streets, the lanes, and climbs the little garden fence,
And folk by thousands droop and die, or blindly moan, bereft of sense."

"Oh watcher look beyond the earth! We sicken as we hear you speak—
This tale of woe has frightened us and stopped the red blood from the cheek.
Look up, look up, is naught beyond? We hold our breath and listen meek."

"I look, and lo, from Heaven above, the coiling clouds are swift unrolled,
And glittering bright, in gate and wall, I see a city all of gold;
The sheening splendours of the place to human ears may not be told."

"The portals open; through them pass a long procession clad in white—
They sing aloud, and thus they sing, 'Here comes no darkness of the night,
But Loss and Famine, War and Plague, yea, even Death, are banished quite.'"

A. N.

MY FIRST CURACY.

CHAPTER X.—SOME CHARACTERS OF THE VILLAGE.

EVERY village and small place contains one or two people who are noticeable, in some way or other, as differing from the rest of the inhabitants, either in dress, appearance, or manner. And these people are "the characters" of the place. They are a source of much amusement to their neighbours, and their sayings and doings afford many a topic of conversation, especially when there is a dearth of local news.

I have already given a brief account of our clerk, always a notable character in any parish, and sometimes a notorious one too. Then you have had the parish choir upon the carpet; a little has been said about the squire and others who figure more or less in the routine of a curate's vocations. But I have omitted all mention of our parish "doctor," and I should be doing a

serious injury to a most worthy man if I did not notice him among other village celebrities. Every one called him "doctor," though I doubt if it was more than a title of usage and courtesy.

In person "Doctor" Jackson was tall and thin, with white hair, regular features, a sharp eye, and intelligent face. In manner he was blunt, and frequently hurt the feelings of his patients by his rough manner and straight-to-the-point way of speaking. But nevertheless, offended or not at his manner, the parishioners would have no one else to attend them. Once indeed, after "Doctor" Jackson had given offence to two of the chief farmers, because he would not leave a poor sick woman, in whose case he was much interested, to attend to their temporary ailments after a late carouse at a tithe-feast, it was thought that an opening was made for a rival practitioner to come and settle in the village. Certainly at times the doctor was greatly overworked, and though it was some satisfaction to know that the rich and poor were treated exactly alike, yet a man who is ready and willing to pay the doctor's fee does not like to wait his turn in the village apothecary's daily rounds. Though the services of an assistant were unceasingly pressed upon him, year after year he always delayed obtaining one.

Accordingly, the two farmers before mentioned did invite a young man, who had passed a creditable examination, to come into the village. He came, it is true, but in six months he left; not from any fault of his own, or from want of skill, but simply because he had no patients upon whom to exert his medical skill. He could not persuade the old parishioners to trust themselves to his care; and the children needed none of his help, for they were, as I have already stated, "crossed" if anything was the matter with them. As for the two farmers who had encouraged the poor young man to come, they were hale, strong men, with good constitutions and powerful lungs; and as no tithe-feast occurred while the new medical man was in the parish, they did not stand in need of his assistance, and we can hardly have expected them to dose themselves with physic in order to accommodate their friend. Sorrowfully he had to pack up his drugs and to betake himself to a district where the inhabitants were less healthy, and where there were not so deeply rooted prejudices against newcomers as in our parish. The failure of the scheme to bring in a rival surgeon, cemented Dr. Jackson's union with all his patients; and the unfortunate farmers were obliged to make an apology to him, and beg him to attend them in case they should be taken ill suddenly, apoplexy not being a disease quite unknown in our village.

I never witnessed such faith as the people possessed in Dr. Jackson's power of healing. If he could only be got to attend, then the relatives of the sick man were quite satisfied. This happy state of feeling might partly have arisen from the superstitious frame of mind which was the natural one among the parishioners, but at the same time we must not forget to render justice to Dr. Jackson's skill and experience in the healing art.

One thing I must not omit to mention: it is that while Dr. Jackson was an authority, a great notable authority for miles round the village, at home the doctor was not the master of the house. Be it gently spoken, Mrs. Jackson was somewhat of a virago, at least she was a tyrant, and ruled the house, her daughters, and her husband, with a more effectual weapon than a rod of iron, namely, a woman's tongue. Some persons ill-naturedly said that Dr. Jackson's assiduous attention to his

patients was owing to the disquietude of his own home, and that he found peace and happiness only when abroad.

Mrs. Jackson was a woman that stood high in the estimation of some of the good people in our parish. Perhaps they did not know as much as I did of her domestic life, for the doctor was a quiet man in all that did not relate to his profession. But I have noticed that sins of temper and of tongue are often too easily overlooked; and, moreover, if religion is real, it will show its reality in daily life as well as in Sabbath profession. I do not wish to say anything against Mrs. Jackson's religion: all I know is that some of the usual fruits of good living were sadly lacking. She did not make her husband comfortable, and she did not adorn her profession, even in outward matters. Her cap was never clean and never straight; her dress too was nearly shapeless, and no efforts either of husband or daughters could ever succeed in rectifying these little matters. If she had been an invalid, or if she had worldly anxieties, there might have been excuse for her, but with everything prosperous, her habitual discontent and repulsiveness really brought discredit on her Christian profession. Of course she was a wet blanket upon any project of a pleasurable nature, however innocent. "Pleasure!" she would say, "is pleasure right? will not pleasure-seekers suffer, and shall not mirth and gladness be turned into mourning?" And then with sundry shakings of the head, she would mutter some words unintelligible, though I was sure they were as disagreeable and "nasty" as possible. Often did the doctor come up to the vicarage, and in his rough-and-ready way, exclaim, poor man, in answer to inquiries after his wife's health, "Oh, worse than ever!" We always knew that something had gone wrong at home; he would generally unburthen himself of his trouble before he left, and we found it invariably proceeded from some difference with his wife. Perhaps it was the accepting or declining of some invitation, all feasts and merry-making being an abomination to her, though relaxation to him. Sometimes as a matter of worldly prudence, especially when the rival surgeon came into the village, did she consent to accept a few such invitations, but she froze the party by her presence, and having made every one uncomfortable around her, she would sit on her chair resigned and gloomily think she had done her duty. Mrs. Jackson did not come to our church. She took an early opportunity of telling the vicar she went where she could get good! And in search of it she had to walk many miles, when she went to church at all. The doctor could not spare his servant or horse in the morning; in fact he was very much opposed to her leaving her parish church, where he in the afternoon was a regular attendant. I remember one very hot day a farmer met her on her return from the neighbouring church, and seeing she was much fatigued, he suggested that her own church was much nearer. She placed her hand on the farmer's arm, and with marked emphasis, in a sepulchral voice replied, "Mr. Carter, even a drop of poison is a very bad thing!" And then shaking her head she went her way, leaving the farmer in a haze as to the proper meaning of her words. Now I do not mean to say that Mrs. Jackson was a bad or an uncharitable woman, because such a statement would be simply untrue, but she was mistaken as to the nature of her religious duties and had allowed her judgment to become thoroughly warped. The result was an unhappy home for the husband at least, if not for the daughters also.

Another celebrity of our parish for a time was "a

coffin." Start not, gentle reader, I have no tale of horror to unfold, but rather to give as true an anecdote of a very eccentric old gentleman. He died worth a great deal of money, which he had invested for the purchase of a number of almshouses for poor widows and widowers. These were located in the neighbouring town, but he was buried in our churchyard in a vault he had himself chosen, and in the building of which he had been much interested. But one extraordinary request was made in his will, namely, that all his mourners, the undertaker and his assistants, and even the horses of the different carriages, were to wear yellow scarfs instead of black. This request was faithfully performed. Another request, or rather bequest (for the payment of an annual sum depended upon the carrying out of this portion of the will), was that a small pane of glass should be fitted into the lid of his coffin; for he had a strong presentiment that he might be prematurely buried, and therefore wanted a window made in order that when people visited his vault they might at once see his body; and to prevent any neglect on the part of his friends, he left a sum of money to be given to certain of them, if for a stated number of years they would inspect his coffin and its contents. When the time was completed, the grave was finally closed.

Another notable person of our village was a sick woman. Upon the authority of her sister (the female who figured as the leading singer in the anthem on an eventful Sunday in the history of the old choir), and of several neighbours, this sick woman had been confined to her bed for seven-and-twenty years. Never once during that long period she had had her clothes put on her, or been moved further than the chair by her bedside! Can we picture to ourselves seven-and-twenty such wearisome years? And Mary Glanville was totally unable to earn anything during that period, or even to raise her hand to her mouth. If a fly rested on her face, there it must remain until some neighbour came in and drove it away, for her sister was a great part of her time away, and consequently Mary was continually left in solitude. She was also dependent upon her relatives for the smallest morsel of food or drop of water: she was completely paralysed.

I went very frequently to see her, and often as I entered the room I thought she was a corpse. She had attained, by long confinement I suppose, a most peculiar pallid appearance. She seldom could bear the window open, it seemed to give her pain; and her head was tied up in the strangest manner I ever saw: it was covered with a kind of nun's cap of linen coming low down upon the forehead, over the ears and covering also the chin, so that her eyes, nose, and mouth, were the only features visible; and from her position, lying straight at full length in the bed, with very little perceptible motion, the resemblance to a corpse was the more striking.

She had the power of speech, however, and spoke nicely, but in a very drawling voice; invariably did she greet me with one set speech, and never missed quoting the text, "I reckon that the sufferings of this present world are not to be compared with the glory that shall be revealed in us." Poor Mary! I hope she has realised the truth of these words, for I have lately learnt that she died about four years ago, after having been confined to her bed, with the rafters and thatch (for there was no ceiling to the room) above her, for thirty-two long years!

Dear readers, when inclined to murmur think of the wearisome months and years passed in a state of utter helplessness by Mary Glanville without repining.

Varieties.

MOSQUITOES.—I was at Monaco last October, and the place at that time was infested by mosquitoes. My wife was attacked by them night and day, and no contrivance, either of net curtains over her bed or lotions prepared by Nice and Mentone chemists, could keep them from her. One day, by accident, she gathered a bunch of wild rosemary, which grows plentifully all along the Riviera, and placed it in her room. From that moment not a single mosquito entered the apartment, and as long as she carried some of it about with her she was quite free from their attacks.

J. H. C.

READING FOR THE BLIND.—The American missionaries at Beyrout lately brought out a new translation of the Scriptures in the Arabic language—the language of 120 millions of the world's population—and they had scarcely begun to circulate it before their attention was arrested by the number of blind Arabic-speaking people, and they determined to prepare for them "The Sermon on the Mount," Matthew v. In order to do this, they set their ingenuity to work, and the plan they adopted was to take twelve sheets of tin, to form the letters in wire, put them in proper order, solder them to the tin, soften the paper, impress it upon the plate, and thus form a beautiful book, a copy of which lies before me. It cost me only 6d., and each sheet of tin with the letters upon it may be had for 1s. It is important to call the attention of the friends of the blind to the fact that they themselves, unaided by a blind asylum, may do almost all that is required for many of the blind.

C. S.

EARNESTNESS IN THE PULPIT.—One day a bishop met Garrick, the actor. The bishop said, "How is it, Mr. Garrick, that your house is crowded, and people pay to get in, while my cathedral is all but empty, though admission is free?" "The reason," said Garrick, "is plain. In my house we speak fiction as if we believed it to be truth. In your cathedral you speak truth as if you believed it to be fiction."

LORD RAGLAN.—Lord Raglan possessed many of the qualities of a great general. The firmness with which he suppressed the murmurs against the expedition at Varna, his coolness and presence of mind under fire, the equanimity with which he bore reverses, the bold front which he presented during the winter of 1864, by which he probably saved the remnant of the British army; the magnanimity with which he bore calumny, when an attempt to defend himself might have jeopardised the French alliance—these are all qualities of a great man, and when added to the military skill which a long experience in a good school of army must have engendered would have obtained for him, under happier auspices, the reputation of a great commander.—*Sir John Burgoyne.*

TAVERN SIGNS.—Taverns and other signs have recently been much written about; but I have seen no notice of "The Gentle Shepherd of Salisbury Plain." Yet such has not only been in existence in England, but an example has found its way to the Cape of Good Hope. Halfway between Simon's Town and Cape Town, Flormer Peck (from England) kept a tavern with the following unique quadri-lingual invitations to the public on his signboard—

Multum in parvo, pro bono publico,
Entertainment for man or beast;
Lekker kost, as much as you please,
Excellent beds, without any fleas.
Nos patriam fugimus, now we are here,
Vivamus, let us live by selling beer,
On donne à boire et à manger ici,
Come in and try, whoever you be."

T.

WATCHGUARDS.—Watches may be easily protected against sudden assault by adopting the following plan:—Let a small ring be firmly sewn inside the waistcoat pocket, and the lower end of the guard-chain passed through it before being attached to the watch. Whatever may happen to the chain will then be of little consequence, as the watch will remain safely in the pocket of the owner.

T. F.

WELSH SAINTS.—To the Romish catalogue of saints Columbus is just now about to be added. As the Welsh claim to be discoverers of America, it might be as well, perhaps, to transmit a few of their canonisations to that country to be invoked at due seasons, if they can only manage to pronounce their names. Ex. gr., Saint Glywys Ceriniw, Saint Gwrddelw, Saint Gwrfyw, Saint Gwrthwl, Saint Cynflyn Drwsgl.

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper.*

NEAR THE HAUNT OF THE TIGERS.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER XV.

My host, in spite of his annoyance, did not forget the duties of hospitality, and warmly pressed our unwelcome visitor to take some refreshment. The young officer, however, declined on the plea that the day was already far spent, and that he had no time to spare. On going round to the front of the house, I found two led horses under the charge of a soldier. They were absurdly small for cavalry, and would have been quickly ridden over by any one of our heavy regiments.

I was about to bid Mynheer Van Deck farewell. "No, not yet, my friend," he answered. "I purpose accompanying you to Cheribon, that I may render you any service in my power. I have a horse, and will follow immediately."

The officer made a sign of impatience, so I mounted one of the steeds, and Jack sprang on the back of the other, where he sat very much as a big monkey would have done, fully resolved, it seemed, to enjoy any fun which might be forthcoming. As the French soldiers treated him kindly, and spoke in a good-natured tone to him, though he could not understand what they said,

his fears quickly vanished, and he was speedily "hail fellow well met" with them all.

The officer I found a very gentlemanly young man. He rode up alongside me after we had proceeded a little way, and seemed eager enough to talk about La Belle France, Paris, the opera, and theatres; but when I endeavoured to draw any information from him respecting the proceedings at the west end of the island, he closed his mouth, or gave only vague answers. From this I argued that affairs had not gone with the French in quite as satisfactory a manner as they wished. I asked him at last whether he thought that I should be detained or be otherwise inconvenienced by the commandant at Cheribon.

"We shoot spies," he answered laconically, at the same time, shrugging his shoulders as a Frenchman only can do. "C'est la fortune de la guerre."

"But, my dear sir, I am no spy," I answered. "The governor, or native chief, purposed to seize my vessel, and I was left on shore while she made her escape. I am but a supercargo anxious to sell the goods entrusted to me."

The young officer gave a smile of incredulity, yet with an air of so much politeness that I really could not be angry with him; indeed it would have done me no good if I were. We were in a short time joined by Mynheer Van Deck, who came galloping up on a much finer horse than any possessed by the French soldiers. I found from my captor that the journey would be far longer than I had expected, as we had to make a considerable detour to visit a native chief, or prince, to whom he had a message. My belief was that he was beating up for native recruits to oppose the British force, which, if not arrived, must have been hourly expected. We had several natives with us, armed with long spears and daggers, a few only having firelocks. Van Deck told me that we should soon have to pass a river, rather a dangerous spot, on account of the number of tigers which came there to drink, and which had already carried off several natives.

"But surely they would not venture to attack so large a body of men as this," I remarked.

"Not if we could keep together, unless they happen to be very hungry," he answered. "Unfortunately, however, the path in some places is so narrow that we have to proceed in single file, and as there are fallen trees and other impediments in the way, travellers are apt to get separated, when, of course, they are more liable to be picked off. I always keep my pistol cocked in my hand, that I may have a chance of shooting my assailant."

"But I came on shore unarmed, and have no pistols," I answered.

"Then keep ahead of me, and if I see a tiger spring at you I will fire at him, and do my best to save you."

"But the poor boy who is with me, he has a poor chance, I am afraid," I observed, after I had thanked my friend for his offer.

"Oh, he is safe enough if he keeps close to the soldiers—the clatter of their arms frightens the beasts."

While the Dutchman was speaking we came in sight of the river. It was fordable, though rather deep, and as the leading men on their small horses plunged in, the water was up to their saddle-girths. I naturally looked out on either side for our expected enemies. Three or four large animals sprang off just as the leading horses reached the opposite bank. I thought they were tigers.

"Oh, no, they are only wild cats," said Van Deck.

"Rather unpleasant to be caught by one of them asleep, but they are easily frightened."

I thought to myself, If those creatures are Java wild cats, what must Java tigers be like? We all passed across the stream without any accident, a small body of half-clad natives bringing up the rear. They were climbing up the somewhat steep bank, when a fearful shriek, followed by loud shouts and cries, made me turn my head, and I caught sight of a monster bounding along the bank with the writhing, struggling body of a human being between his huge jaws. The poor wretch's *sarung*, or plaid, had become loose, and dragged after him. Already several natives were setting off in chase, while others were discharging their firearms at the animal, though at the risk of killing the man. The French officer called out to them to desist, and, seizing a lance from one of the people, gallantly dashed after the tiger. I naturally wished to join in the chase, but Van Deck entreated me to stop, telling me that I should very likely, if I went, be picked off by another tiger on my return. As it would have been folly to disregard his advice, we pushed on as fast as we could to get out of the narrow defile. We could for several minutes hear the shouts of the natives still in pursuit of the tiger. After some time they rejoined us, but they had not saved the poor man, and had moreover lost another of their number, who had been carried off by a tiger just as the first leaped over a cliff fifty feet above the valley with the man still in its mouth. It was followed triumphantly by its companion.

"This is not the country I should choose to travel in, still less to live in," I said.

"It cannot be helped," observed the Dutchman. "I am well off here, a great man among small people. I should be a beggar elsewhere. This is not, however, the country in which a man of education and mind would choose to pitch his tent."

Torches were lit for the latter part of our journey. It will be remembered that so nearly under the equator as we were the days and nights are of equal length all the year round, we therefore did not enjoy the delightful twilight of a northern clime.

Notice had been given of our proposed visit to the chief, or prince, who was, I was told, of Malay descent. Preparations were therefore made for our reception, and very handsome they were. Though a prisoner, I was treated like the rest of the guests. The house was much in the style of those I have before described. But I was not prepared to find a table elegantly set out and spread with fine linen and beautiful silver plate. It was lighted by four large wax flambeaux in massive silver candlesticks. The provisions were dressed in the Malay fashion, many of the dishes being very palatable, and an abundance of excellent Bordeaux was provided, in which toasts were drunk with three times three, the Malays of inferior rank, who sat round the room on the ground against the walls to the number of thirty, joining in the huzzas. It was altogether a curious scene of barbaric splendour. The prince escorted us to our rooms, where we found capital beds, beautiful linen, and very fine mosquito-nets, ornamented with fringe. The Malay servants slept under the beds on mats, or in the corners of the rooms, to be in readiness if required. Breakfast was prepared at daybreak, that we might continue our journey in the cool of the morning.

We rested under the shade of some trees during the day, the soldiers keeping up a fearful din to scare away any wild beast who might chance to be prowling about in search of a dinner. The young officer had fortunately a French cook among his men, who very soon contrived

to place before us a capital dinner, though of what it was composed I could not discover. I rather think that hashed monkey formed one of the dishes. As, towards night, we approached Cheribon, my kind Dutch friend did his best to keep up my spirits, assuring me that he would spare no pains to prove that I was not a spy. He was not quite sure that the accounts received of the defeat of the English were correct; and the French commandant would scarcely venture to hang me without very strong proofs of my guilt, and with the possibility of being made a prisoner himself by my countrymen ere long, should they have been victorious. Still it was with no very pleasant feelings that I was formally conducted into the fort as a prisoner.

The forts of Cheribon had been allowed to fall into decay by the Dutch, but since the French occupation of the island had been repaired and considerably strengthened. I was told that the commandant boasted that he could hold out against any force likely to be sent against him, even should my countrymen gain the day. I was taken at once before him, and examined, but though he had no evidence to prove me guilty, as I was accused of being a spy he would not take my parole. I was by his orders accordingly locked up in a cell with iron bars to the windows, a three-legged stool, and a heap of straw in a corner for a bed. Mr. Van Deck had not entered the fort. In a little time Jack was thrust into the cell with very little ceremony. He brought me a message from my Dutch friend, saying that there had been a battle, and he suspected that the French had been defeated. I heartily hoped that he was correct. I had reason to believe that my prison, bad as it was, was the best in the fort, for Jack told me that he had seen guards going round with messes of food which they put into wretched dark holes, and in one as he was led along he saw a miserable gaunt man with long matted hair put out a lean yellow hand to take the food. This information made me hope more than ever that Van Deck was right in his suspicions, for I had no fancy to be shut up in a dark cell for months in such a climate, with the possibility of being taken out and shot as a spy. Had I been a naval or military man, I should not have been thus treated. Several very unpleasant days and nights passed by, a scanty allowance of coarse food only being brought to me and my young companion. The sergeant of the guard, however, intimated that if I would pay for it he could procure me a bottle or so of Bordeaux. He was as good as his word, and I believe that without the wine I should have fallen ill.

At length one day the sergeant threw open my prison-door, and Van Deck appearing took me by the hand and led me out of my noisome dungeon, followed by Jack, who gave a shout of joy as he found himself in the open air.

"I sent to Batavia, where your ship has arrived, and where your statement was fully corroborated, and the commandant had therefore no further excuse for keeping you a prisoner," said my friend. "But there is another reason why he would not venture to do so much longer—look there!"

He pointed seaward, where several large ships were seen approaching the land. He handed me a glass. I examined them eagerly. They were frigates, with the flag of old England flying at their peaks. Jack, when he heard this, gave a loud huzza and threw up his cap with delight, jumping and clapping his hands, and committing other extravagances, till I ordered him to be quiet, lest the French soldiers should put a sudden stop to the exhibition of his feelings.

The frigates approached till they had got just within

long gunshot range of the fort, when after some time a boat put off from one of them, and approached the fort bearing a flag of truce. That was at all events pleasant. There was a chance of a battle being avoided, yet the commandant had so loudly sworn that nothing should make him yield to the English, that I was afraid he might be obstinate and insist on holding out. We were on the point of hurrying down to meet the boat, when a sergeant with a guard stopped us and told us politely enough that we must stay where we were, or that Jack and I must go back to prison.

"We must obey orders," observed Van Deck. "The fact is, that the commandant is aware that you are acquainted with the weak points of the fort, that the gun-carriages are rotten, and many of the guns are themselves honeycombed or dismantled."

We were conducted out of the way when the officer with the flag of truce entered the fort. Looking from the ramparts, however, we could see the boat and the people in her through Van Deck's glass, and a young midddy was amusing himself, so it appeared to me, by daring some little Dutch or rather native boys to come off and fight him, which they seemed in no way disposed to do, for whenever he held up his fists they ran off at a great rate. Of one thing I was very sure, that if the French commandant did not yield with a good grace, he would be very soon compelled to do so. That squadron of frigates had not come merely to give a civil message and to sail away again. We walked up and down impatiently, waiting to hear what was to be done.

At length, after an hour's delay, the officer who had brought the message, Captain Warren, of the President, issued from the commandant's house with his coxswain bearing a flag under his arm. Down came the tricolour of France, and up went the glorious flag of England. Jack was beside himself on seeing this, and I could scarcely refrain from joining in his "Hurra! hurra!" as I hurried forward to meet the English captain, whose acquaintance I had made at the Mauritius. The French commandant intimated, on this, that I was at liberty, but, as I felt that it would be ungrateful to leave my friend Van Deck abruptly, I resolved to remain on shore for the present with him.

In a very short time the marines came on shore to secure the thus easily acquired possession, but scarcely had they formed on the beach, than it was ascertained that a large body of the enemy had entered the town. The order was given to charge through them, and, taken by surprise, the French and Dutchmen threw down their arms, and several officers and others were taken prisoners. Among them was General Jumel, second in command to General Janssen, and Colonel Knotzer, aid-de-camp to the latter, who with others were at once carried off to the ships.

Cheribon I found to be a much larger place than I at first supposed; the streets are narrow but numerous, and in the outskirts especially the houses of the natives are so completely surrounded by trees and bushes, that it is impossible to calculate their number. I heard that the Phœbe was one of the squadron, and soon had the satisfaction of shaking hands with my brother William, Toby Trundle, and other officers belonging to her. From them I heard a full account of the engagement which had given the greater part of the magnificent island of Java to the English. I was the more interested as my military brother had taken part in it, and distinguished himself. I hoped to meet him when I got to Batavia.

The army, which was commanded by Sir Samuel

Auchmuty, consisting of 11,000 men, half being Europeans, disembarked on the evening of the 5th of August at the village of Chillingchin, twelve miles north of Batavia. Colonel Gillespie advanced on the city of Batavia, of which he took possession, and beat off the enemy who attempted to retake it. A general engagement took place on the 10th at Welteureden, when the French were defeated and compelled to retire to the strongly entrenched camp of Cornelis. It was supposed to contain 250 pieces of cannon. Here General Janssen commanded in person, with General Jumel, a Frenchman, under him, with an army of 13,000 men. Notwithstanding this, the forts were stormed and taken, and the greater number of the officers captured. The commander-in-chief, with General Jumel, escaped—the latter, as I have mentioned, to fall very soon afterwards into our hands.

An expedition consisting of marines and blue jackets was now organised to meet a body of the fugitive army said to be marching from Cornelis. As William was of the party, I got leave to accompany it. That we might move the faster, horses had been obtained, and both marines and blue-jackets were mounted; that is to say, they had horses given them to ride, but as the animals though small were frisky and untrained, they were sent very frequently sprawling into the dust, and were much oftener on their feet than in their saddles. Our force as we advanced certainly presented a very unmilitary appearance, though we made clatter enough for a dozen regiments of dragoons. We were in search of the military chest, said to be with the fugitives. We fell in with a large party, who, however, having had fighting enough, sent forward a flag of truce and capitulated. We got possession, however, of some waggon-loads of ingots, but they were ingots of copper, and were said to be of so little value in the country as to have been fired as grape-shot from Cornelis. The moon shone brightly forth for the first part of the march, but no sooner did it become obscured than a considerable number of the marines were seized with a temporary defective vision very common within the tropics, called nyctalopia, or night blindness. The attack was sudden; the vision seldom became totally obscured, but so indistinct that the shape of objects could not be distinguished. While in this state the sufferers had to be led by their comrades. With some it lasted more than an hour; with others not more than twenty minutes, and on the approach of day all traces of it had disappeared.

On our march, during the heat of the day, we passed through a wood, every tree in which seemed to have been blasted by lightning. Not a branch nor leaf remained to afford us shelter from the scorching rays of the sun. Had I not known that the story of the noxious effects produced by the upas-tree was a fiction, I might have supposed that the destruction had been caused by a blast passing amid the boughs of one of those so-called death-dealing trees in the neighbourhood. Probably the forest had been destroyed partly by lightning, and partly by the conflagration it had caused.

On returning to Cheribon, I found that my friend Van Deck was anxious to proceed to Batavia, and I was fortunate in being able to procure him a passage on board the *Phoebe*, which was going there at once.

"Well, Braithwaite, I shall never despair of your turning up safe," exclaimed Captain Hassall, shaking my hand warmly as I stepped on the deck of the *Barbara*. "You saved the ship and cargo by your promptness, for had I not got your message by young Jack there, I should have been captured to a certainty.

Garrard, Janrin, and Co. have reason to be grateful to you, and I have no doubt that they will be so."

Everybody knows that Batavia is a large Dutch town built in the tropics—that is to say, it has broad streets, with rows of trees in them, and canals in the centre, of stagnant water, full of filth, and surrounded by miasma-exuding marshes. But the neighbourhood is healthy, and the merchants and officials mostly only come into the town in the daytime, and return to their country-houses at night. Some seasons are worse than others, nobody knows why. Captain Cook was there on his first voyage round the world during a very bad one, and, in spite of all his care, lost a number of people. We were more fortunate, but did not escape without some sickness.

Captain Hassall had disposed of most of that portion of our cargo suited for the Batavian market, so that I soon got rid of the rest. I then made arrangements for the purchase of sugar, tea, coffee, spices, and several other commodities which I believed would sell well at Sydney, to which place we proposed to proceed, touching at a few other points, perhaps, on our way.

The articles had, however, first to be collected, as the army had consumed the greater portion in store at Batavia. Part of the purchase I made from a brother of my friend Van Deck. He was on the point of sailing in a brig he owned along the coast to collect produce, and invited me to accompany him. I gladly accepted his offer, as the *Barbara* could not sail till his return.

In those days, as well, indeed, as from the memory of man, these seas swarmed with pirates—many of whom had their head-quarters on the coast of Borneo. Among them was a chief, or rajah, named Raga, notorious for the boldness and success of his undertakings. We, however, believed that with so many British men-of-war about he would seek some more distant field for his operations. The harbour was full of native craft of all sorts. Of the native prahus alone there are many varieties, some built after European models, and carrying sails similar to those of our English luggers. Others are of native construction, with lateen sails; and many, built with high stems and sterns, have the square mat sail, such as impel the Batavian fishing prahus. Of course among so many craft a pirate chief could easily find spies ready to give him information of all that was going forward. However, we troubled our heads very little about the pirates.

By-the-bye, I have not said anything about the alligators of Java, which are, I believe, larger than in any other part of the world. The government will not allow those in the harbour of Batavia to be disturbed, as they act the part of scavengers, by eating up the garbage which floats on the water, and might otherwise produce a pestilence. I often passed them floating on the surface, and snapping at the morsels which came in their way, quite indifferent to the boats going to and fro close to them. Captain Beaver, of the *Nisus* frigate, described to me one he saw in another part of the island, when on an exploring expedition. It was first discovered basking on a mud-bank, and neither he nor the officers with him would believe that it was an animal, but thought at first that it was the huge trunk of a tree. At the lowest computation it was forty feet in length. The circumference of the thickest part of the body seemed nearly that of a bullock, and this continued for about double the length. The extent of the jaws was calculated to be at least eight feet. The eyes glistened like two large emeralds, but with a lustre which nothing inanimate could express. The officers

examined it through their glasses, and came to the conclusion that it was asleep; but the native guides assured them that it was not. To prove this, one of them fearlessly leaped on shore and approached the creature, when it glided off into the water, creating a commotion like that produced by the launch of a small vessel.

I bade farewell to William and my friends of the *Phœbe*, not without some sadness at my heart. In those times of active warfare it might be we should never meet again. Of my soldier brother I got but a hurried glimpse before he embarked on an expedition which was sent to capture Sourabaya, at the other end of the island. A few words of greeting, and inquiries and remarks, a warm long grasp of hands, and we parted. Directly I stepped on board *Van Deck's* brig, the *Theodora*, the anchor was weighed, and we stood out of the harbour with a strong land breeze. The easterly monsoon which prevailed was in our teeth, so that we were only able to progress by taking advantage of the land and sea breezes. The land breeze commenced about midnight, and as it blew directly from the shore, we were able to steer our course the greater part of the night; but after sunrise the wind always drew round to the eastward, and we were consequently forced off the shore. The anchor was then dropped till towards noon, when the sea breeze set in. Again we weighed, and stood towards the shore, as near as possible to which we anchored, and waited for the land breeze at night.

We had thus slowly proceeded for three or four days, having called off two estates for cargo, when, as we lay at anchor, a fleet of five or six prahus were seen standing towards us with the sea breeze, which had not yet filled our sails. *Van Deck*, after examining them through his glass, said that he did not at all like their appearance, and that he feared they intended us no good. On they came, still directly for us. We got up all the arms on deck and distributed them to the crew, who, to the number of thirty, promised to fight to the last. Then we weighed anchor and made sail, ready for the breeze. It came at last, but not till the prahus were close up to us. Under sail we were more likely to beat them off than at anchor. They soon swarmed round us, but their courage was damped by the sight of our muskets and guns. Of their character, however, we had not a shadow of doubt. After a short time of most painful suspense to us they lowered their sails and allowed us to sail on towards the shore. Here we anchored, as usual, to wait for the land breeze. Had there been a harbour, we would gladly have taken shelter within it, for the merchant, the elder *Van Deck*, said that he knew the pirates too well, and that they might still be waiting for an opportunity to attack us. There was, however, no harbour, and so we had to wait in our exposed situation, in the full belief that the pirates were still in the offing, and might any moment pounce down upon us. The *Van Decks* agreed that we might beat them off, but that if they should gain the upper hand, they would murder every one on board the vessel. "We might abandon the vessel, and so escape any risk," observed the merchant—not in a tone as if he intended to do so. "You, at all events, Mr. Braithwaite, can be landed, and you can easily get back to *Batavia*." Against this proposal of course my manhood rebelled, though I had a presentiment, if I may use the expression, that we should be attacked. "No, no! I will stay by you and share your fate, whatever that may be," I replied. Night came on, and darkness hid all distant objects from view.

We were in the handsome, well-fitted-up cabin, en-

joying our evening meal, when the mate, a Javanese, put his head down the skylight and said some words in his native tongue, which made the Dutchmen start from their seats, and seizing their pistols and swords, rush on deck. I had no difficulty, when I followed them, in interpreting what had been said. The pirate prahus were close upon us.

A LADY'S JOURNEY THROUGH SPAIN.

CHAPTER VI.—THE SIERRA NEVADA.

BEFORE leaving Granada, I should give a short account of some excursions we made in the neighbourhood. We went to the *Soto de Roma*, about nine miles from the city, an estate which in old times belonged to the kings of Granada, and was frequently bestowed on court favourites. After the victory of Salamanca, the Cortes granted the estate to "our duke, who held it, as it is called, in fee simple and unentailed." It contains between 4,000 and 5,000 acres. The small village of *Roma* lies on the banks of the *Xenil*. The town of *Santa Fé*, built by Ferdinand and Isabella during the long siege of Granada, is easily visited on one's return to the town; it is only curious from its associations, as it is in a most dilapidated state; but the capitulation of Granada was actually signed there, and it is also interesting in no common degree as the spot from whence Columbus set forth on his voyage of discovery.

Our next excursion was the ascent of the *Sierra Nevada*. We started soon after daylight. To those used to mountain expeditions there is no difficulty worth speaking of, not even for ladies. We had good strong mules, which we preferred, but horses may be had for those who like them. There is a very practicable way nearly to the summit, formed entirely by those who go every day at nightfall to procure snow for the consumption of Granada; their mules have made a regular track. The people employed in this work are called "*Neveros*," and the cavalcade is a very picturesque sight as it winds down the narrow path, each mule with its heavy load of snow, and the *Neveros* in their singular dress, looking well suited to the scene and the employment. We had very good intelligent guides, one to each mule; I never allowed mine to wander far from my bridle-rein, only far enough to procure me some of the numerous beautiful wild flowers growing all around. One halt we made at what is called the *Piedras de San Francisco* (the rocks of Saint Francis). The dark gloomy masses show strongly on the brilliant white of the *Sierra*. We then came upon the vast snow pits that bear so different an aspect when seen from below, looking hardly bigger than white spots on the mountain side, but in reality they are wide extended snow fields that never wholly disappear, not even in the most glowing summer heat. We had taken with us every sort of protection against the cold that either our own ingenuity or the kindness of friends could suggest, for we intended passing the night on the mountain in order to witness the sunrise from the summit. Not only were we provided with outward wraps, but with inward restoratives; and the night was most glorious. We had started so early that we had much time at our disposal after we reached the stone edifice built as a refuge for travellers, but there was so much to amuse us as we rambled about, so many lovely, or rather grand peeps of scenery to see, such curious stones to be picked up, such wild legends to listen to told by the guides, that we could hardly believe our eyes when watches were produced and we found the

time for our evening meal had arrived. Words would fail to give any description of the glory of a starlight night on the mountain.

Our guides took care to rouse us in good time, that we might get to the summit before the sun was up. They had made a blazing wood fire in order to warm us, and that we might enjoy some scalding hot coffee before our start; and very picturesque the fire looked in the dim light, as we turned back to take a last look at our bivouac. We rode as far as we could, and then leaving the mules we started for the final walk that was to bring us to the summit; it was very steep, but we did not mind it, and the morning promised to be glorious beyond description. At last a loud shout of rejoicing from all the guides told us the welcome news that the goal was reached, and we threw ourselves down on the cloaks spread for us to recover breath and strength before we gazed on all the wonders around. The sun was just showing his bright crimson and gold rays, colouring everything with gorgeous hues. We stood on a small platform as it were, with a deep abyss immediately below us; volumes of mist still rolled all over the lower valleys; the beautiful blue sea lay on one side, with a dim horizon line beyond it; rocky peaks, mountain summits, were below and around. Little by little the golden light ascended, and the eye grew more accustomed to the scene. It was a wonderful panorama indeed!

Another pleasant ride took us to the spot bearing the melancholy name of "El Ultimo Suspiro del Moro." It was on that very spot, as history tells us, that Boabdil turned to take a last lingering farewell look at his beautiful city.

CHAPTER VII.—TO MALAGA.

At length the day came when beautiful Granada must be left behind. Many and many a time we called a halt in the cavalcade that we might take yet one more look at the Vega spread out like a verdant carpet, and at the glorious Sierra Nevada glistening in all its snowy beauty, for we started at that early hour, when, if the sky is clear and free from mists, the summits stand out against the blue sky as though carved in ivory. Last looks must be taken by others besides King Boabdil, and so finally, with sincere regret, we turned our faces and our thoughts towards our onward journey. We were to ride from Granada to Malaga, and thence proceed to Seville, and with so much enjoyment in prospect we had not time to dwell upon our regrets for past pleasures. Most delightful our journey proved.

We rode horses, and found them altogether less fatiguing than mules, whose paces are decidedly trying. Anything more wretched than the village of Caini, situated nearly at the lowest point of a funnel-like ravine or gorge, I never saw; perhaps it struck us more from the contrast it presented to the scenes we had just left. Then we passed the mineral baths of Alhama. As usual, the Moorish bath is far the best, and very picturesque; the water must be very hot, for clouds of vapour rose up from it. These baths are considered very efficacious in cases of rheumatism. We reached Alhama about four o'clock in the afternoon. Its situation is striking, and the artist might fill his portfolio with sketches taken from different points of view. Houses seem to be perched on the very edge of precipitous cliffs; their gardens look as if suspended in mid-air; the vines cover every trellis, climb here, there, and everywhere; and far down below the foaming river, the Marchan, boils in agitated tumult, forming nume-

rous cascades, and supplying water for the different mills.

Beyond Alhama the mountains are sterile and gloomy, but they have an air of wild grandeur that served to enhance our view the next morning of Vinnela, a small town or village lying in the very lap of plenty. In that rich summer season the abundance of produce of all sorts was astonishing.

As we rode on, and came in sight of Velez Malaga, we really were unable to express the extent of our admiration and delight. On a steep rock are the remains of an old Moorish castle, with the town clustered about it; spires, and convents, and towers, all in a picturesque confusion. The streams of water rushing down the sides of the mountains have brought in their course rich moist soil to fertilise the beautiful valleys of Velez; and the extraordinary luxuriance caused by the plentiful moisture, joined with the burning sun of that country, is almost incredible. Nothing can exceed the beauty of Velez Malaga with its vine-clad mountains, the lovely blue sea, and the enchanting climate to give added delights to all this beauty. Truly it may be said to be a land of oil and honey, for the honey made in the neighbourhood is most delicious, and it is exported in large quantities, while much is used in the preparation of various delicate confections. There are all the advantages of tropical climates, but none of the terrible scourges that usually accompany them. We see the tall stately palm-tree, but no scorching sandy desert; here the sugar-cane, which was brought to Spain in the days of the Carthaginians, flourishes in perfection, and yet our feelings are not distressed by the thoughts of the slave labour employed in the cultivation. So delightful did we think Velez Malaga, that, contrary to our intention, we lingered on day after day. Summer was in all its glory, for the heat had not lasted long enough to burn up its verdure. The sea breezes, too, were most invigorating, not to mention the delightful sea-bathing. The nights we spent in the midst of these scenes are never to be forgotten. The air was softer, warmer, purer, than any I have ever felt even in Madeira, where I spent a winter.

We were anxious to reach Seville before the burning August heats came on, so the orders were given and we were once more on our way. We soon found we had only passed on from one spot of exquisite beauty to another in every way equal to it. Malaga is between soft sloping hills and the bright waters of the Mediterranean. The climate is thought to be more salubrious than any other that Europe can boast of, and I can easily believe it from all I heard during our stay. Rain is almost unknown, and yet there is no burning heat, owing to the sea breezes, and the temperature in winter at the lowest is 50°.

The province of Malaga, of which this beautiful city is the capital, is without doubt the richest in Spain. The most valuable metals, the most rare and beautiful marbles abound in the hills that surround it; its floral treasures are varied and abundant. Sugar, cocoa, coffee, cotton, all are cultivated with great success; and the situation of the city on the bay gives every advantage for exporting all the varied produce of the land. Its fame as a trading port was well known to the Phœnicians, and for more than 3,000 years has it retained its commercial existence. It has from times of the most remote antiquity been the chosen residence of some of the merchant princes of different nations, and it is most interesting during a stay there to trace back its history. There is a curious custom, a remnant of old times: the great bell of the cathedral tolls three times on the 18th

of August every year at three in the afternoon, in commemoration of the terrible siege that was laid to the town by Ferdinand in 1487. On that day it surrendered, upon good terms as they were considered; but Ferdinand, with his usual faithlessness and treachery where the Moors were concerned, broke every promise he had made, and the success of the Christian army was celebrated by every sort of horror. Yet the sufferings of the Moors were quite equalled in later days, when the town was sacked by the French troops.

The ladies at Malaga are charming. We made acquaintance with some very agreeable families, and generally spent our evenings in the midst of a most delightful society. There is great beauty amongst the Malaguenas; they are most attractive, gay at times, and full of sprightly and piquant ideas, while at other times their mood changes, and they display all the fascinating languor and grace of the Orientals. When they heard it mentioned incidentally that I kept a journal, and described all I saw and heard with a view to its publication, their intense eagerness to know in what terms I had spoken of them was very amusing, and it was all displayed with a *naïveté* that gave it a great charm in our eyes. Their kindness and courteous hospitality during our stay will not easily be forgotten.

An extensive trade is carried on at Malaga in dried fruit, especially raisins. The kind of grape that is cultivated to be dried, is called the *Una Larga* (or large egg grape). They are sent to foreign parts in jars of a shape similar to those found in Pompeii. The manner of preparing them is by cutting the stalk partly through, and leaving them hanging in the sun. A million boxes or jars are exported every year. The Malaga sweet wines are also very celebrated; they are called muscatel wines. The sea air is supposed to be highly beneficial to the vines; they cover the hills sloping down to the sea for leagues and leagues around Malaga.

THE MIDNIGHT SKY AT LONDON.

OCTOBER.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

PERHAPS one of our first practical lessons in sidereal astronomy consists in noticing that peculiar apparent motion in stellar objects, so evident on a brilliant starlight night in winter, known as the twinkling or scintillation of the stars. This phenomenon, with which most of our readers have been acquainted from early youth, by the nursery rhyme, "Twinkle, twinkle, little star," has occupied the attention of scientific men for a long period, among others, Aristotle, Ptolemy, Tycho Brahe, Galileo, Kepler, Hooke, Newton, Young, and Arago. To the unassisted eye, it consists of very rapid changes in the intensity of the lustre of the stars. These changes are also frequently accompanied by corresponding variations in colour, observations of which have been recorded by more than one astronomer. Forster, in 1824, not only noticed the variability of colour, but he endeavoured to obtain an idea of the law by which the changes took place.

One of the popular notions by which we distinguish a planet, consists in the comparative absence of any scintillation of its light, which consequently shines with a much more steady lustre than that of the fixed stars. But twinkling is not always a sure distinction between the light of the fixed stars and planets, for, in certain conditions of the atmosphere, the latter have been known to scintillate more or less, and the phenomenon is also much more observable in the fixed stars on some nights

than on others. Many writers have given explanations of the cause of twinkling, each differing in some respects from the others, and even at the present time differences of opinion exist. Some have accounted for the phenomenon by the undulatory theory of light, by which the direct rays from the star reach the eye at regular and successive intervals of time, causing the object alternately to appear and disappear. But M. Arago considered that the scintillation of the stars is nothing more than a rapid change in their intensity and colour originating in our atmosphere, in which the progress of the stellar rays is interfered with by the unequal heating, density, or humidity of the different strata. The principal cause of the scintillation may be supposed to arise, therefore, from the unequal refraction, or bending, of the rays of light as they pass through aerial currents of different temperatures and densities. That this is so, is evident from the variability of stellar twinkling depending on the distance of the stars from the horizon. For example, it is generally much more visible in stars at a low altitude, where the density of the atmosphere is always the greatest, while its minimum effect exists in the zenith, where the least density prevails. This law of twinkling, according to the altitude of the object, is not, however, universal, for several of the principal fixed stars, on account of the nature and peculiarity of their own light, vary considerably in the intensity of their scintillations independently of their position in the heavens. Procyon and Arcturus are known to twinkle much less than Vega, the brilliant bluish-white star in Lyra. Kaemtz states that "planets scintillate less than stars, because as the latter appear to us as points, the least displacement, were it only a few seconds, would be sensible to our eye. The planets having a visible disk, it is more difficult to appreciate their apparent change in volume; however, through telescopes we frequently see the edges scintillate, especially if they are near the horizon." Aristotle curiously explained the phenomenon as the result of a mere strain of the eye, for he says "the fixed stars sparkle, but not the planets; for the latter are so near, that the eye is able to reach them; but in looking at the fixed stars the eye acquires a tremulous motion owing to the distance and the effort." M. Wolf, Astronomer at the Imperial Observatory of Paris, has lately made some observations of the spectra of the stars at a time when the scintillation appeared very great. He has noticed on these occasions several series of broad bands pass from one end of the continuous spectrum to the other, which apparently confirms the changing colour of the stars, according to the theory of M. Arago.

M. Dufour, who made an extensive series of observations on stellar twinkling at Morges, Switzerland, has found that the phenomenon varies frequently from one day to another. But it increases or diminishes proportionally for all the stars, excepting those near the horizon, where the twinkling is always large. It has also been observed to increase during the time of twilight, and when clouds are in the sky driven rapidly before the wind. During those nights in which the scintillation was very marked, M. Dufour noticed that the stars in all directions, including the zenith, were affected; but on nights when the phenomenon was less decided, all the zenithal objects shone steadily. In tropical countries, scintillation is but seldom observed in stars at a high elevation above the horizon, and then only to a very limited extent. Humboldt remarks that in Peru stars scintillate when near the horizon, but not at more than twenty degrees above it. Garcin, in a letter to M. Reaumur, published in the "Histoire de

L'Academie des Sciences, 1743," states that "in Arabia, in spring, summer, and autumn, the inhabitants sleep on the roofs of their houses. It is impossible to describe the pleasure experienced in contemplating the beauty of the sky, the brightness of the stars, and their apparent motion from east to west, while thus lying in the open air. The light of the stars is pure, steady, and brilliant; and it is only in the middle of winter that a slight degree of scintillation is observed."

Stars of the first magnitude twinkle much more than those of the second, while in the smallest stars visible

INDEX-MAP, LOOKING NORTH, OCTOBER 15.

to the unassisted eye, the scintillation is altogether inappreciable. In the magnificent cold starlight nights of winter, this tremulous motion of the fixed stars creates an erroneous impression of their number. We are led to suppose, from their flickering in all directions, that we perceive more luminous points than the eye is really capable of distinguishing at any one time. Hence the popular surprise when informed that all the visible stars on the clearest of nights amount to less than two thousand.

Observations on the scintillation of the stars have been made by several observers in elevated positions on the earth's surface, especially by Saussure in the

INDEX-MAP, LOOKING SOUTH, OCTOBER 15.

mountainous districts of Switzerland, and Professor C. Piazzi Smyth on the Peak of Teneriffe. At the latter place, Professor Smyth was much struck by the quiet and steady planetary light of the stars, and was inclined at first to believe that there was no scintillation; but he soon found that this phenomenon even existed at his

elevated station of 10,702 feet, although to a much smaller extent than at the foot of the mountain. Dr. Tyndall noticed in 1859, from the Grands Mulets, on Mont Blanc, at an altitude of nearly twelve thousand feet, that when Capella first appeared near the horizon on the evening of August 13, the star scintillated very distinctly, but that at 2 A.M. on the morning of the 14th, the twinkling was scarcely perceptible. From this observation of Dr. Tyndall, we may conclude that, when viewed from the summit of Mont Blanc, the stars shine with a steady light. During a residence at the hospice of St. Bernard in the summer of 1856, M. Dufour also found that the scintillation was very trifling. Whether this absence of the phenomenon at such great elevations occurs at other seasons of the year, we have no recorded observations to show.

The occasional twinkling of the planets consists only of a slight tremulous motion of their disks when near the horizon. It has been noticed principally in Mercury, Venus, and Mars. But in such cases, the phenomenon is so difficult to observe, that practically it may be concluded that, to the naked eye, any displacement resulting from it is too minute to be perceived by any but practised observers.

At midnight in October, the eastern and south-eastern sky is becoming enriched by some of the most conspicuous constellations, including Orion, Taurus, and Gemini, but, excepting Taurus, they are outside the limit of the diagrams. Andromeda, Perseus, and Cassiopeia, now meet in the zenith, near which several important stars are visible. Let our attention be first directed to the lower or south diagram. The stars situated a few degrees east of the zenith belong to Perseus; Algol, or Beta Persei, in Medusa's head, being near the south edge of the Milky Way. Proceeding downwards towards the eastern horizon, or the upper part of the left-hand side of the diagram, we pass over the eastern corner of Taurus, and the second star in that constellation, Nath, or Beta Tauri. East of this star, but too near the horizon to be included in the diagram, several stars in Gemini and Canis Minor are visible, Procyon having just risen due east. Confining ourselves to this portion of the heavens for the present, or rather in an E.S.E. direction, the splendid group of first and second magnitude stars in Orion, which add so much lustre to the winter sky of the northern hemisphere, can be seen without any special instruction. Between Algol and Orion, but nearer the latter, Aldebaran and its companion stars, the Hyades, are easily recognised. A line drawn from the zenith through Algol to the three stars in the belt of Orion, passes through the Hyades. The universally-known Pleiades group can be seen to the right of Aldebaran. In the south-east, most of the sky is occupied by Eridanus, an extensive constellation, but as it contains no star greater than the third magnitude visible at London, this portion of the heavens appears bare in comparison with that to which we have just drawn the reader's attention. Eridanus extends from near Rigel, the south-west star in the quadrilateral of Orion, to within a few degrees of the south meridian near the horizon.

The following constellations are now on or near the south meridian, beginning at the zenith: Andromeda, Triangulum, Pisces, Aries, Cetus, and Sculptor, the last mentioned being in the horizon. Although there are but few large stars now on the meridian, those belonging to the separate constellations can be pointed out easily in the diagram, if we recollect that a line drawn from the zenith through the exact centre as far as the south

E

W

THE MIDNIGHT SKY AT LONDON, LOOKING SOUTH, OCTOBER 15.

horizon, will represent the corresponding position of the celestial meridian, looking south. Not very far from the zenith, a star rather brighter than those near, and slightly left of the meridian line, is Gamma Andromedæ, a beautiful triple star. One to the right of the meridian is Mirach, or Beta Andromedæ. A little lower, above two conspicuous stars, Alpha Trianguli can be noticed, the two large stars being respectively Alpha and Beta Arietis. To the right of these, a line of small stars in Pisces may be seen, marking the position of the two fishes and their connecting ribbon. Below Pisces a few stars of the third and fourth magnitudes belong to Cetus.

West of the meridian, the principal constellations above the horizon at midnight are Pegasus, Equuleus, Pisces, Aquarius, and portions of Andromeda, Cetus, and Sculptor. The chief stars on this side of the meridian are those in Andromeda and Pegasus. That near the zenith, a little to the right of the meridian, we have already pointed out as Beta Andromedæ. Between it and Alpherat, is Delta Andromedæ, of the third magnitude. The stars composing the celebrated square of Pegasus have been explained in preceding months; it is enough, therefore, to say at present, that Alpherat, or Alpha Andromedæ, is the nearest of the four to the zenith, Beta Pegasi is in the north-western corner of the square, Alpha Pegasi, or Markab, in the south-western, and Gamma Pegasi in the south-eastern. A tolerably bright star to the right of the square, and nearly at the limit of the diagram, is Epsilon Pegasi. That south-west of Markab is Zeta Pegasi, and in the same direction two others near the right-hand limit of the diagram, are Gamma and Alpha Aquarii. The only object of large magnitude south of these stars, Jupiter excepted, is Beta Ceti, which may be noticed towards the lower part of the diagram on the right-hand side of the meridian. Jupiter, as in last month, is in the constellation Pisces; he is the most brilliant object now above the horizon.

Pisces, the Fishes, is the twelfth and last of the zodiacal signs, and one of the original forty-eight asterisms of the ancients. It is represented on celestial globes and maps as two fishes widely separated from each other, with their tails joined together by a long ribbon or string. This constellation occupies a considerable space in the heavens, one of the fishes being situated under the right arm of Andromeda, and the other under the wing of Pegasus. A good guide to the position of the two fishes may be obtained by reference to the four stars in the square of Pegasus, a line drawn from Alpherat to Gamma Pegasi being parallel to the body of one fish, while another line from Gamma Pegasi to Markab is likewise parallel to the other fish. Pisces is bounded by Andromeda on the north, by Aries and Triangulum on the east, by Cetus on the south, and by Aquarius and Pegasus on the west. Alpha Piscium, of the third and a half magnitude, is a close double star, and the largest in this constellation. The colours of the two components of this beautiful object are a pale green and blue. About forty stars are visible to the naked eye in Pisces, of which Ptolemy recorded the approximate positions of thirty-eight. Bode's Atlas contains two hundred and fifty-seven. In addition to Alpha Piscium, there are several double stars included within the boundaries of Pisces, but although some of them are of an interesting character, there is nothing unusually remarkable in their appearance or history to require any special notice.

Owing to the retrogression of the equinoxes, that point of the heavens intersected by the celestial equator and ecliptic at the vernal equinox, and which in ancient

times was situated in Aries, is now a considerable distance west of that constellation. It is really far advanced in Pisces, which is strictly the first sign in the zodiac of the present age. However, astronomers, for the sake of uniformity, still retain the technical name, "the first point of Aries," by which this zero-point has been for ages known. It is not likely that the order of the zodiacal signs, commencing with Aries, will be disturbed for a similar reason, notwithstanding that Pisces is the habitation of the sun at the beginning of his annual course.

Andromeda is situated in a favourable position for observation in the latitude of London, where that portion of the constellation nearest the pole never sets, the remainder being also above the horizon during a considerable part of the year. In celestial maps, the figure of Andromeda is placed near those of her father, mother, and lover, Cepheus, Cassiopeia, and Perseus. She is represented in the bonds, which, according to the heathen mythology, she carried with her to the stars. Pegasus and Lacerta are on the west of Andromeda, Pisces on the south, Cepheus on the north-west, Cassiopeia on the north, and Perseus and Triangulum on the east. There are two hundred and twenty-six stars in Andromeda catalogued by Bode, about thirty of which are clearly visible to the naked eye. The principal star of this constellation is Alpherat, or Alpha Andromedæ, in the lady's head, and in the north-east corner of the square of Pegasus. This object heads the list of standard stars in the Nautical Almanac, whose accurate right ascensions and declinations are given for every ten days throughout the year, to be used for delicate astronomical purposes. The second star in magnitude is Beta Andromedæ, or Mirach, formerly placed by the Arabian astronomers in the northern fish's head. Mirach is of the second magnitude, and of a fine yellow colour. Delta Andromedæ is about midway between the two chief stars Alpherat and Mirach. The situation of the latter star can be pointed out by drawing a line from Alpha Ceti, or Menkar, through the two bright stars in Aries. Or if we follow the directions of the poet; its position in the sky will be very evident, Markab being the south-west star in the square of Pegasus.

"From Markab run a line beneath th' imprison'd lady's head,
And over *Delta* on her back to Mirach 'twill be led."

Gamma Andromedæ is a beautiful triple star in the lady's ankle, and is a very favourite object for amateur observation. This star was first seen double by C. Mayer, in 1778. The principal component is of the third magnitude, and of an orange-yellow colour, while the smaller one is between the fifth and sixth magnitudes, and of a bluish colour. In 1842, M. Struve, of the Pulkowa Observatory, announced that with his large equatorial he found that the smaller component actually consisted of two stars. This discovery has since been verified by other astronomers, and this object is now looked upon as one of the severest tests of the penetrating power of an astronomical telescope. It requires, however, one with an object-glass of a large aperture to be able to separate the smaller star into two.

Cassiopeia is now situated near the zenith, its principal stars having just passed the meridian. In the diagram of the north sky they are near the upper boundary line, forming some resemblance to an antique chair, of which the lower portion is composed of Alpha, Beta, Gamma, and a smaller star, Kappa. Beta is the most westerly of all, and Alpha the most southerly. To see Cassiopeia in the heavens at midnight in October, the observer's face being directed towards the north,

it is best to find first the position of the polar star, and then gradually to look upwards, almost to a point overhead. Between Polaris and Cassiopeia, there are no objects of sufficient magnitude to attract attention, excepting perhaps Gamma Cephei, which would be almost touched by a line drawn from Beta Cassiopeia to Polaris. In the north-western quadrant of the sky, several stars of large magnitude are visible in different directions, including Vega, Altair, and Deneb. From the zenith to the north-western horizon, we pass through Cassiopeia, Cepheus, Cygnus, Draco, Lyra, and Hercules. Looking due west, or along the upper boundary line of the diagram, there is no star sufficiently bright to notice especially, but towards the W.N.W., following the course of the Milky Way, several stars in Cygnus may be pointed out. The first is Deneb, or Alpha Cygni. That west, or to the left of Deneb, is Gamma Cygni, in the Milky Way. In the other arm of the Milky Way Epsilon Cygni may be seen. Zeta and Delta are apparently above and below the Milky Way respectively. North of Cygnus, the position of Lyra can be recognised by Vega, and the two neighbouring stars, Beta and Gamma Lyrae. To the right of Vega, and near the north meridian, Gamma and Beta Draconis are conspicuous, and below these several stars in Hercules are near the horizon. Below Cassiopeia, and between Cygnus and the meridian, Cepheus is situated. The two principal stars in Cepheus can be found by drawing a line from Alpha Cygni to Polaris, Alpha Cephei being the nearer one to Cygnus. All the chief stars in Ursa Minor are now to be found between Polaris and the north horizon. Kocab and Gamma Ursa Minoris at one end, and Polaris at the other, define the extent of this small but important constellation. Between Kocab and the horizon, the sky is occupied by portions of Draco and Boötes. Alkaid, the last star in Ursa Major, is exactly on the meridian.

East of the meridian the principal stars above the horizon are Capella, Castor, Pollux, and those in Ursa Major. In addition to these the planet Mars is a bright object north of east, about six degrees above the horizon. With the exception of Ursa Major, all the chief stars in this quarter of the sky are in E.N.E., and mostly in Perseus, Auriga, and Gemini. These three constellations are now partly in the northern, and partly in the southern half of the sky. Due east from the zenith, the nearest large star is Alpha Persei. The next conspicuous object is Capella, followed by Beta Aurigæ, and below these Castor and Pollux may be easily recognised in the heavens, Castor being the upper star of the two.

Perseus is principally a northern constellation, and for the most part circumpolar. It is one of the forty-eight asterisms of the ancients, and is situated in a very conspicuous part of the Milky Way, directly north of the Pleiades. Its chief stars are Alpha Persei, sometimes called Mirfak, and Beta Persei, or Algol. The latter is one of the most remarkable of the variable, or periodic, stars. The variation in lustre of this star was first noticed by Montanari in the seventeenth century, but its periodicity was first accurately determined in 1782 by Goodricke. Algol varies in magnitude from the second to the fourth in about three and a half hours, and back again to the second in the same interval of time. It continues at its greatest lustre during the remainder of its period, which has been ascertained to be about two days, twenty hours, and forty-nine minutes. Perseus contains several interesting stellar objects, one of which in his right-hand we give as an illustration. This beautiful cluster is scarcely visible to the naked eye,

even as a single star, but when viewed through a good telescope it exhibits a brilliant mass of stars, varying from the seventh to the fifteenth magnitudes. While gazing on this superb telescopic object we can well realise the poet's description of—

"Some sequestered star
That rolls in its Creator's beams afar,
Unseen by man; till telescopic eye,
Sounding the blue abysses of the sky,
Draws forth its hidden beauty into light,
And adds a jewel to the crown of night."

STAR CLUSTER IN PERSEUS.

In this beautiful cluster, the central group resembles a coronet, or rather an ellipse of small stars. The comparatively bright star to the right in the diagram is of the seventh magnitude. Sir William Herschel considered that this cluster, and another which follows it closely, belong to the Milky Way, in which they are situated. These two clusters are perfectly disconnected from each other, although the outlying stars in each can be brought into the field of view of a telescope at the same time. On very clear nights in winter they form, when taken together, one of the most interesting telescopic objects in the heavens. The writer recollects the great delight he felt when he was first shown these clusters, at a time when such objects were novel to him, and although thirty years of official experience have passed away since then, the impression on his memory of this first view of these gorgeous groups has never been effaced.

Our diagrams for October 15, with the accompanying descriptions, will be useful for the examination of the heavens on August 15 at 4 A.M., on September 15 at 2 A.M., on November 15 at 10 P.M., on December 15 at 8 P.M., and on January 15 at 6 P.M.

In October, 1868, Mercury is too near the sun to be observed favourably. He sets shortly after the sun during the month, and cannot therefore be seen with the naked eye.—Venus is still the principal morning star, rising on the 1st at 1.43 A.M., on the 15th at 2.10 A.M., and on the 31st at 2.45 A.M. On the 12th, in the afternoon, she will be in conjunction with the moon, behind which, by the aid of a telescope, she may be observed to disappear at 3.2 P.M. She will be rather near the W.N.W. horizon at the time, and before she emerges from the opposite side of the moon, both objects will have set. During the morning hours, before sunrise, Venus may be recognised due east.—Mars is also a conspicuous morning star in October, but there is no fear of any one mistaking him for Venus, Mars having a decided ruddy tinge, while Venus is a brilliant white. Mars rises on the 1st at 11.24 P.M., and on 31st at 10.55 P.M.—Jupiter rises on the 1st at 5.36 P.M., on the 15th

at 4.39 P.M., and on the 31st at 3.32 P.M. He is consequently now very favourably situated for observation, and is a beautiful evening telescopic object, with his four attendant moons. Jupiter is above the horizon all night at the beginning of the month, but at the end he disappears below it nearly three hours before sunrise.—Saturn can only be seen during this month in the south-west, as an early evening star, for an hour or two after sunset. He sets on the 1st at 7.41 P.M., and on the 31st at 5.52 P.M.—Both Uranus and Neptune can be observed as telescopic objects in October throughout the night.

The moon will be only a short distance from Jupiter on the evening of the 1st. On the 5th she will be near the Pleiades, and on the morning of the 6th near Aldebaran. On the 10th she will be in conjunction with Mars, and on the morning of the 12th Venus, Regulus, and the moon will be near each other. On the 28th, during the evening, the moon will be again near Jupiter at 8 P.M., when they will only be separated by about two degrees. At this time both objects are in the constellation Pisces.

The principal lunar phases are as follows:—Full moon on the 1st, at 7.58 P.M.; last quarter on the 9th, at 6.13 A.M.; new moon on the 15th, at 11.1 P.M.; first quarter on the 23rd, at 9.42 A.M.; and full moon, for the second time this month, on the 31st, at 11.5 A.M. The moon is nearest to the earth, or in perigee, on the 13th, and most distant, or in apogee, on the 25th.

LIFE IN JAPAN.

VIII.—AMUSEMENTS.

THE public amusements of the Japanese are nearly as varied as those of more western nations. Dramatic representations, including equestrian performances, wrestling matches, feats of skill and strength, rope-dancing, conjuring, etc., afford them entertainment.

There is no desire to shorten the enjoyment of theatrical displays, neither are they reserved for the evening time. A large square, or horseshoe-shaped space, is surrounded by temporary erections of two storeys. The upper one is reached from the outside, and partitions are set up at regular distances: each of these boxes will contain a family, and may be hired by the day or week. The enclosure is open to the sky, and the stage extends along the whole of one side. The audience are summoned by the sound of a rattle (which is sometimes continued for two or three hours). They are in the habit of providing themselves with provisions and refreshments; and a whole day can be passed quietly in witnessing the performances, which are sometimes of a soothing, sometimes of a rousing, character. Scenes of love and hatred, revenge and retribution, form the subject of their dramas. Male and female performers act the parts. Comedy does not enter largely into these compositions; but single combats are frequent, and seem to be much appreciated by the lookers-on. Their history, which has been of a most varied and striking character, furnishes them with numberless plots, and love, jealousy, and murder, supply the usual quota of domestic incidents. In some of the representations several plays are carried on alternately, that is, the first act of number two succeeds the first act of number one, and number three that of number two, and then the second and following acts of the three plays are performed in similar order; thus spectators can choose which piece they will follow, and in the intervals they may retire and attend to their business or pleasure.

At some of the theatres the performers pass through the midst of the audience to reach the stage, in order to familiarize them with the dress of the part they are acting, as the great object of a Japanese actor is to represent as many different characters in the same piece as possible. There are seldom more than two or three personages on the stage at one time, so this can be effected without much difficulty.

Occasionally the performance is so natural that the tragic episodes exercise great effect upon the more susceptible of the audience, and tears are freely shed when the hero of the piece, who ought to wed the fair heroine, falls a victim to the sword, or is secretly poisoned by a rival; but, as a rule, the performance goes smoothly on without much demonstration of feeling on the part of those who are present. In fact, the length of time through which these performances continue prevents any excessive outburst of emotion, as it would be impossible to keep the feelings harrowed and sympathy excited for a week or so on account of the woes of those who are palpably acting their parts; for the broad daylight which shines around, and the absence of accessories in the shape of scenery and lights, renders the task of a Japanese actor a particularly difficult one. Gorgeous dresses of silk and satin are worn, both the materials and colours being much richer than those which are in common use.

Besides set theatres, with a regular *corps dramatique*, itinerant performers are met with in the streets, who represent shorter plays and scenes. Both women and men in these small companies have their faces hideously coloured with red and white paint. Their dresses are poor, compared with those of the superior class of actors. They soon gather a large crowd around them in the busy streets, and seated or standing on mats and cushions, they recite their parts and enact the scenes in the open air, the spectators throwing down a few cash or a tempo when the performance is concluded.

The equestrian performances are rather plays on horseback than scenes in the circle, and consist of mounted actors, who ride in and out gesticulating, fighting, and going through mimic combats, while managing their wild-looking steeds on the wooden platform; a great clatter ensues, but the results are by no means terrific. In an exhibition of this nature, witnessed at Nagasaki, the only feat worthy of note performed by the horses was the ascent and descent of a somewhat steep wooden staircase; but as all travellers in Japan are constantly passing up and down stone steps when mounting the hill-sides and visiting the temples, such a performance was by no means extraordinary.

Japanese jugglers deserve a special mention from the great dexterity they exhibit in some elegant and surprising feats of skill. Nothing can be prettier in that way than the celebrated butterfly trick. A conjuror twists a piece of thin paper into the shape of a butterfly with outstretched wings; he then places it on his fan, and with a slight movement launches it into the air, where it flutters about, now settling on the edge of the fan, whose gentle motion regulates its movements, now flying high in the air, and then once more hovering over the fan with all the fitful gracefulness of a live insect. A second fan is sometimes brought into requisition, and the butterfly passes from one to the other, or flies away seemingly directed alone by its own will; the illusion is rendered still more perfect when another butterfly joins its companion, and the two together flutter about, hovering over a bunch of flowers, which the conjuror holds in one hand, seemingly sipping their sweets as they rest for a few seconds on the coloured petals, and

then dance away again on their airy flight. A teapot is held out, and the butterflies quit the bright flowers and rest on its rim; then they fly inside, as if anxious to explore the dark interior, and are lost to sight for a few seconds; but they soon emerge and flutter about more gaily than ever, glad, it would seem, to regain the light and liberty. One experiences a feeling of regret when the pretty graceful butterflies are at length ruthlessly caught and torn to pieces, so completely do they seem animated creatures, and not mere toys.

Top-spinning is also carried to perfection in Japan. The tops are of various sizes and shapes, chiefly that of a brightly painted wooden cylinder, pierced by a small round metal axis, on which the cylinder moves freely. Others are more like umbrellas, but nearly all can be made to revolve in extraordinary places. For instance, a top is set spinning along the edge of a sharp sword, on a slender piece of twine, or up an ascent and into the interior of a box, where it strikes a certain number of bells and then emerges at an open door, still spinning as fast as when it commenced its curious journey. It is well to mention, as another peculiarity of Japanese top-spinning, that this journey is made on the side of the cylinder, and not on the point of the axle. Family—or, as they are sometimes called, hen and chicken—tops are also common. A large top contains a number of small ones, and while the large one revolves these pop out one after the other, and commence spinning around the parent top, which is soon surrounded by a number of small ones, all turning so rapidly that the eye can scarcely see them move.

The tops vary in size from three inches to three feet in circumference; sometimes a large top is, as it were, wound up to such a degree that the sides of smaller tops are applied to its side, and the momentum thus acquired is sufficient to set them spinning at once. From time to time the performers wipe their hands on their paper pocket-handkerchiefs, so that no moisture may impede the perfect action of the top. The top is removed from place to place with the greatest freedom, the equilibrium being maintained, whether it is spinning on the point of a bamboo or on the surface of a flat table.

Birds are trained to play many tricks; to select cards, pull up small buckets, carry weapons, and run up ladders, open doors, etc. The clever little performers hop about with a well-satisfied air, and are rewarded for a successful trick by the present of a hemp seed. When going through their mimic labours they are quite at liberty, and have the full use of their wings, but do not attempt to escape, and seem perfectly under the control of their trainer, who, with his assistant, carries the cages and apparatus from village to village, stopping at the country houses of the better classes, and at the residential parts of the temples, where he exhibits his little companions' skill to the admiring eyes of the ladies of the establishment. There is a serious gravity of demeanour about these exhibitors, when, seated on their heels, and dressed in dark silk garments, they direct the movements of the birds, which renders these performances far more picturesque than similar ones in England.

Some of the balancing is also very extraordinary. The Imperial Japanese troupe, at present exhibiting in this country, give examples of these efforts of skill and strength. Some of them are in the highest degree sensational; yet but few persons feel alarmed at these exhibitions, so calmly do the performers go through their evolutions, and each one manifests such perfect confidence in the address and skill of the others. It is also a feature of Japanese exhibitions, that

a number of assistants are always at hand, dressed in handsome garments, who stand about in picturesque groups, and, while adding to the general effect of the scene, are prepared to act should an emergency arise. Sensational as many of our exhibitions are, they are equalled by those of the Japanese rope-dancers, bamboo-climbers, and acrobats, who appear to have learnt from the monkeys the art of ascending upright poles, and of clinging by the toes and hands to the smoothest surfaces; and while the performer is in a position which to an ordinary person would be one of the greatest danger to life and limb, he calmly draws out his fan from his girdle and begins to fan himself, regarding the spectators below with a self-complacent and nonchalant air. A juggler lies on his back and balances a huge tub on his feet, and puts it through a variety of evolutions; a number of buckets are placed under it in succession, and raise it to a considerable height; after balancing these for a short time, first on one foot and then on the other, he kicks away the small buckets, and catches the large tub upon his feet. A boy sometimes is introduced, and takes the place of the large tub.

Musicians, either male or female, accompany these exhibitions with their tinkling guitars and sharp-toned flutes. Feats of posturing and agility are also performed, and boys, whose vertebral columns must resemble india-rubber, put their heads between their legs, double themselves up, and walk in the most crab-like fashion; and when two of them are gambolling together, it is difficult to distinguish to which individual the respective heads and limbs belong. Some street mountebanks dress themselves up in a feathery head gear, or draw over their heads a mask, which makes them resemble frogs, whose movements they imitate.

WRESTLERS.

The Japanese differ from the Chinese and Hindoos in the value they attach to athletic games, and wrestling is the national sport. Wrestling matches are therefore amongst the most popular exhibitions.

Each Damio has a number of professional wrestlers attached to his establishment, who, like the gladiators of old, devote their existence to trials of strength. These men are remarkable for their muscular development, and they take a great pride in the size and strength of their limbs. They are attended by servants, who wait upon them, hand them their fans, and dress and undress them, for when they engage in wrestling they are all but perfectly naked; but this is not remarkable in a country where the men of the lower or working classes throw off their loose garments the moment they have any extra work to perform. Wrestling is not reserved for the professionals, but nearly all Japanese men exercise themselves in it, and when the labours of the day are concluded, arrange matches amongst themselves. A circle is formed, the spectators squatting on their heels, and two antagonists step into the ring. First they assume the national attitude of sitting on their heels, then they each take up a handful of earth and cast it over their shoulders, and watch each other like two cats, intent upon a spring. Several feints are generally made before an opportunity arises of seizing each other. The great object of each one seems to be to throw his opponent over his head; and when a skilled wrestler encounters a novice, this is quickly done; in other cases, the contest continues for some time, the wrestlers exerting their utmost strength, and entwining their limbs round each other in their efforts to throw one another. But no ill-feeling seems engendered, and there

are no spiteful blows or savage looks, but the conquered and the conqueror part in perfect good temper. A succession of antagonists enter the circle, until all have exhibited their prowess or tried their strength. It is not alone at matches that they thus exercise themselves. If two coolies meet who have nothing particular to do, they may be seen striving with one another; and in default of a living antagonist, a strong young sapling has been seen to serve as a substitute, the wrestler putting forth all his strength and pushing against the tree, as if endeavouring to overturn it. This national characteristic is doubtless an indication of the greater vigour of mind and body possessed by the Japanese, and which causes them to present a strong contrast to the more enervating forms of ancient civilization met with in Asiatic communities.

MY FIRST CURACY.

CHAPTER XI.—SOME SPECIAL CASES.

THERE exists no parochial clergyman but has met with cases of peculiar interest in the course of his ministrations. I will endeavour to relate in this chapter one or two of the most interesting cases that fell under my immediate notice in my first curacy.

In a former part of my narrative I have alluded to three burials in one family. The case was as follows. Abraham Adams had been a tradesman from early manhood in one of our neighbouring towns; indeed he succeeded his father in his business, that of a tailor, and at one time was well-to-do in circumstances. But when he was about thirty years old, the hereditary disease of his family, consumption, attacked him; it had previously carried off several of his relatives. He strove against its insidious progress as long as he was able, but was soon obliged to relinquish an active share in the management of his business. This declined, and the foreman robbed him, and absconded with so much ready money, that Adams was made a bankrupt. The family honourably paid all their debts, but when this was done, very little, in fact only a few pounds, remained to them. They gathered all together, and took a lodging in a poorer part of the town. Here Adams became rapidly worse, and as the only means of saving his life, the surgeon who attended him ordered him into the country. Hopes were created which were only raised to be blighted, for when he arrived at our village, I saw upon my first visit that there was not the slightest chance of his recovery. He was extremely patient under his trying affliction, but he did not live long after he came into the parish. On the particulars of his illness and my repeated visits I will not dwell, though to me, as a clergyman, they were gratifying and hopeful.

One remarkable and sad coincidence occurred at this trying period. Adams's two sons caught scarlet fever, and it was so violent in its attack that they both died on the morning of the fifth day after they were taken ill. The same evening their father died. Thus was the poor wife bereft of her husband and two sons in one day.

But a worse personal calamity also quickly befel Mary Adams. Her eyesight had been rather defective for some time; indeed, during her husband's illness she had rather overstrained it by taking in a little needlework, so she told me, in the town where she had lived. But now, from excessive grief at her triple loss, and from anxiety of mind with regard to the future, in six weeks time from the death of her husband and children she became totally blind, and when I left the parish she

remained in that sad state without the slightest hope of restoration.

The father and two sons were buried on the same day, and the overflowing congregation testified to the deep sympathy excited by the sad events. We succeeded in raising a sum of money for the widow, as the distressing nature of her affliction created sympathy on every side. With the money she purchased a mangle, and was promised the linen belonging to many families; she was only able to turn the handle of the mangle, while her little girl, the only child left, laid the linen straight within the rollers.

It was a saddening sight, and also pitiful, though comforting in another view, to see the eagerness with which this woman tried to learn the raised letters of Moon's type for the blind. How very quickly she learnt to master the difficulty! Perhaps this arose partly from the fact that she had been a pretty good scholar in her earlier years; but, however this may have been, certainly God does seem, when he deprives any of his creatures of one sense, to sharpen and strengthen the powers of those remaining. Very regularly was the widow to be seen in her wonted place in the house of God, led by her little daughter; and I know that it often caused a feeling of shame in the minds of other people, to behold her peaceful resigned expression of countenance, knowing how light their own trials were compared with hers.

I have previously stated that the wages of an agricultural labourer in this part of Devonshire were very low, compared with those of other counties. But the smallness of the pay of the farm-labourer was distanced by the poverty of the needlewomen in the district.

A manufacturer in the nearest town contracted very largely with Government for shirts for the army and navy, and these he was accustomed to have made by the women living in the villages surrounding his warehouse. But he paid these women very badly, and must have made a very large profit from his different contracts. Two old women in my district had been employed by him for many years. But after all, what was their remuneration? Threepence-halfpenny a shirt, in which they had to work six button-holes, and to find their own needles and thread!

One of the poor old creatures informed me that she had been engaged in this kind of shirt-making for ten years; that when she had mastered the little difficulties which have to be encountered at first learning any trade, her fingers were so nimble that she could regularly make three shirts a day, which were all able to bear the severe strain of the "approver and weigher;" but now that she was getting old, and her fingers stiffening with rheumatism, she could only with difficulty make one shirt during the day.

I could tell even of worse things than this, for I really found some of our women engaged upon coarser shirts for a French house, receiving the mere pittance of twopence halfpenny each shirt, working four button-holes in each, and finding their own needles and cotton! Surely Hood's poem was no fable.

Another case I have to report which was painfully interesting. I was called upon, in the vicar's absence, to go immediately and visit a man said to be dying in one of our most remote hamlets. With a little difficulty I found my way to the house I was in search of, if it was allowable to apply such a term to a building consisting of a mere decayed heap of "cob," with the thatch off in many places, and with large stones placed on the remaining portion to keep it from being entirely blown away. A broken gate and neglected strip of ground led to this dilapidated-looking dwelling. Two noisy

and rather savage dogs made their appearance at my approach, and I was obliged to shout out for them to be tied up before they would allow me to come nearer to the house. I have a legitimate horror of Devonshire dogs, having been bitten by them no less than six times in the space of five years. When at last I succeeded in entering the cottage—and even to effect this I had to step over a couple of puddles of dirty water, a potato-skin heap, and another of peat ashes—I found that the interior was even in a worse condition than the badness of the outside could have prepared me for. Filth of every description lay scraped into little heaps on the floor, which having been deprived of its tiles, presented an uneven appearance. In the midst of all this dirt was a truckle bedstead; there was an old mattress on it, but no blankets, and the sheets were entirely in holes. On this bed was the object of my visit. As he lay there, I should have said he was probably about fifty or fifty-five years of age, though I afterwards found that he was much younger. He was, or rather had been, exceedingly handsome; he possessed most regular features, curly black hair and beard, the latter at the period of my visit tinged with grey. He presented a marked contrast to his female companion and attendant, whom the neighbours called his wife. She was coarse, common, and bloated, from her constant drinking habits. I found that the man was in the last stage of consumption. My visit on this occasion was very short, as the atmosphere of the room was more than I could bear; besides which, I found out that the man was very deaf, and as I had to approach close to the bed in order to make him at all sensible of what I was saying, I had to keep a strict watch, lest the innumerable vermin which crawled about in all directions should be attracted to myself as fresher prey.

The next day I repeated my visit, for I was anxious to make some faint impression upon the man who I thought would not have lasted many days, though he actually lingered for nearly a month.

I made inquiries if he had no relatives who could come and see to his wants, or at least send some assistance, as he evidently stood in need of the common necessities of life, and even of common decencies also. The woman told me the sick man had a sister, and that she had written for her to come immediately, and, added she, "she is a perfect lady." I was somewhat surprised to hear this statement, but the man's features and manner showed plainly enough that he was not of the lower orders of society.

On the day of my third visit the sister arrived, and very thankful indeed I was to see her there, for she had brought a large supply of things with her, and immediately had clean bed-linen supplied, and sent off to the nearest town to procure blankets and other necessities. Her brother was too far advanced in his illness to be removed to better lodgings, even if they could have been obtained. His sister told me his history.

"The name he now bears," she said, "is not his own, he has borrowed it from the woman with whom he lives: His father was a colonel in the army, his mother was the daughter of an Irish Earl. His godfathers were a peer of the realm and a baronet. His brothers, three of them in number, died early in life as officers in the army, cut off by the same disease which is now approaching a fatal termination in himself.

"He is only forty-one years of age, though he looks so much older. His father died when he was quite young, and his dying words to his wife were, 'bring Edward up tenderly.' This request, it is needless to say, was literally fulfilled. He was brought up ten-

derly, too tenderly as it proved, for his wayward temper first led him into many a boyish scrape, afterwards ripening into manhood's vices.

"When seventeen years of age, a commission was procured for him in the Indian army; he soon afterwards set sail from his native country and joined his regiment. In India his temper, which he had never learnt to control, led him into a great deal of trouble, and a love of gambling and drinking which soon developed itself, encircled him with large debts. These his dotingly fond mother paid. Soon afterwards, however, he committed such an offence against all military honour, and morality in general, that he was obliged to resign his commission and return to England. His disgrace was a crushing blow to his mother, it broke her heart, and she died.

"A few months after, appearing to be deeply penitent, a most excellent appointment was procured for him in Australia, a post of influence and trust. He went out provided with everything suitable to his new position. Here, however, as soon as the novelty of the situation wore off, his old bad habits were renewed with tenfold intensity, and a second time he returned to his native land covered with disgrace.

"A rupture took place between himself and his family. I, his sister, paid all his debts and settled a small sum upon him to be paid monthly through the family lawyer. For four years he entirely disappeared, and would never let us know where or how he was living. At length we traced him to a low part of the east end of London, and found him living with the vilest associates. Our efforts were in vain to reclaim him, and I never met him until the day I came here and saw him in this awful condition. When he was in London he met with this woman, and they passed as man and wife. A feeling of shame perhaps induced him to drop his own surname and adopt hers instead. I must, however, do her the credit to say that she persuaded him to leave the vile neighbourhood in which they were located, and they removed to a back street in the west central district of the metropolis. She obtained the washing of some of the more respectable families in the neighbourhood." And he, when he was sober, employed himself in ironing the linen, and was so lost to shame that he actually carried it home to the very houses where he had formerly dined as an equal. Their quarrelsome habits and their drunkenness combined, lost them the washing of respectable people, and his illness increasing they were obliged to move into cheaper lodgings. They tried to support themselves by keeping a sweet shop for children, but failed; and at last they resolved to sell all they possessed and come down into Devonshire, where they vainly hoped the climate would perhaps restore him to his wonted health."

Such was the melancholy history told me by this lady. She was much distressed at the sad condition of her brother, and most anxious about the state of his soul. The payment of his debts had much impoverished her, as they were of very large amount. She remained in the neighbourhood for three weeks, until her brother died, seeing him and attending him every day. She seemed satisfied with the sincerity of his repentance, but I confess that his excessive deafness made it an extremely difficult task to make him at all sensible of what was addressed to him, and when he seemed to understand there was little response.

What a sad ending was this to a life so happily and prosperously commenced; and what a lesson of warning to young men should this record be of a thoroughly wasted life!

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cooper*.

BATAVIA FROM THE SEA.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER XVI.

I HEARTILY acknowledge that war is hateful to God, and ought to be, indeed is so, to man also, the nearer by faith, by love, by charity, by mercy, he approaches to the nature of God. Fighting, even in a worldly point of view, is, I conceive, a disgrace to the boasted mental powers of the human race; still more so is it to our professed Christianity: and it behoves us to strive and pray for the time when wars may cease, and peace be established among men. But I have faith in one

means alone, the spread of real, vital Christianity. We have learned from the sad experience of centuries that nominal Christianity, which men call religion, is utterly powerless to stop warfare; it may, in a few instances, have lessened some of its horrors, but only a few. The annals of the wars which have taken place for the last three hundred years since the world has improved in civilization show that nations rush into war as eagerly as ever, and that cruelties and abominations of all sorts, such as the fiercest savages cannot surpass, are committed by men who profess to be Christians. Read the accounts of the wars of the Duke of Alva and

his successors in the Netherlands, the civil wars of France, the foreign wars of Napoleon, the deeds of horror done at the storming and capture of towns during the war in the Peninsula, not only by Frenchmen and Spaniards, but by the British soldiers, and indeed the accounts of all the wars in the pages of history, and we shall learn what a fearful and dreadful thing war is, and strive to assist the spread of the true principles of the Gospel as the only means of putting a stop to it.

Such thoughts as these had been occupying my mind on board the brig, on the morning of that eventful day of which I have just been speaking. Here was I, a peace-loving man, engaged in a peaceable occupation, and yet finding myself continually in the midst of fighting, and now there was every probability of my having to engage in a desperate battle, the termination of which it was impossible to foretell. As I reached the deck I could see a number of dark phantom-looking objects gliding slowly over the water towards us almost noiselessly, the only sound heard being that produced by their oars as they dipped into the water. The pirates, for such we were still certain they must be, expected, perhaps, to find us asleep. The guns were loaded and run out as before. The men stood with their muskets in their hands, and pikes and cutlasses ready for use. The strangers drew closer and closer. They still hoped, we concluded, to catch us unprepared. We, however, did not wish to begin the combat unless they gave us indubitable signs of their intentions. The elder Van Deck, who had, I found, been a naval man, took the command, and everybody on board looked up to him. We were not left long in doubt that the strangers were pirates, and purposed to destroy us. Not, however, till they were close to us with the evident intention of boarding, did our chief give the order to fire. The effect was to make them sheer off, but only for a moment. Directly afterwards they arranged themselves on our starboard bow and quarter, and commenced a fire with gingalls, matchlocks, and guns of various sorts, sending missiles of all shapes and sizes on board us. Our men kept firing away bravely, but in a short time, so rapid was the fire kept up on us, that three or four were killed and several wounded. I was standing near the brave Dutchman when a dart shot from a gun struck him, and he fell to the deck. I ran to raise him up, but he had ceased to breathe. His death soon becoming known among the crew, their fire visibly slackened. The pirates probably perceived this, and with fearful cries came dashing alongside. The Javanese are brave fellows, and though they knew that death awaited them, they drew their swords and daggers and met the enemy as they sprang upon our deck. On came the pirates in overwhelming numbers, their sharp creeses making fearful havoc among our poor fellows.

I saw that all was lost. I was still unwounded. Rather than fall alive into the hands of the pirates, as with the survivors of the crew I was driven across the deck, I determined to leap overboard, and endeavour to swim to land. That was not a moment for considering the distance or the dangers to be encountered. Death was certain if I remained in the ship. Unnoticed by the enemy, I threw myself overboard, and struck out in the direction, as I believed, of the shore. I was a good swimmer, but light as were my clothes, I was not aware of the impediment they would prove to me. Already I was beginning to grow tired, and to feel that I could not reach the shore. Yet life was sweet, very sweet, in prospect. I prayed for strength, and resolved to struggle on as long as I could move an arm. I threw myself on my back to float. I could see the brig, at no great

distance, surrounded by the prahus. All sounds of strife had ceased. Only the confused murmurs of many tongues moving at once reached my ears. Now that I had ceased for a few minutes to exert myself, two fearful ideas occurred to me: one, that I might be swimming from the land, the other, that at any moment a shark might seize me and carry me to the depths below. Had I allowed my mind to dwell on these ideas, I should speedily have lost courage, but instead I had recourse to the only means by which, under similar trials and dangers, a man can hope to be supported. I turned my thoughts upwards, and prayed earnestly for protection and deliverance.

I was striking out gently with my feet to keep myself moving through the water when my head struck something floating on the surface. I turned round, and found that it was one of the long bamboo buoys employed by the native fishermen on the coast to mark where their nets, or fish traps, are placed. They are very long and buoyant, and capable of supporting more than one man with ease. I threw my arms over the one I had found, and was grateful that I had thus found an object by means of which my life might possibly be preserved.

I looked round me; the prahus and brig were still to be seen, but after watching them for some time, they appeared to be drifting away with the faint land breeze from the spot where I lay. Thus was the danger of being seen by them at daylight lessened. Hitherto I had feared, among other things, should I be unable to swim on shore, that when the pirates discovered me in the morning they would send a boat and give me a quieting knock on the head. Still my position was a very dreadful one. Any moment a passing shark might seize hold of me; that I escaped was owing, I think, humanly speaking, to my having on dark clothes, and my having kept constantly splashing with my legs. I was afraid of resting, also, lest I should lose consciousness, and, letting go my hold of the bamboo, be swept away by the tide.

I will not trouble you, my friends who read this narrative, with my thoughts during all the time I was hanging on to the float, further than to say that I did not lose my trust in God, and that it kept me calm during this trying period of suspense. At length, when my legs became weary of moving about, I thought that I would try the effect of my voice in keeping the sharks at a distance. I first ascertained that the pirate prahus had drifted to such a distance that I was not likely to be heard by them, then I began shouting away at the top of my voice.

What was my surprise, as soon as I stopped, to hear an answer! For a moment I fancied that it must be some mockery of my imagination; then again I heard the voice say, "What, Braithwaite! is that you?"

It must be, I knew, my friend Van Deck who spoke, yet the voice sounded hollow and strange, very unlike his.

I can scarcely describe the relief I felt at discovering, in the first place that my friend had escaped, and then on finding that a civilized human being was near me. I could not tell whether he knew that his brother was killed. I did not allude to the subject. We did our best to encourage each other. We would gladly have got nearer together to talk with more ease, but were afraid of letting go our hold of the support, frail though it seemed, to which we clung. Van Deck encouraged me by the assurance that it would soon be daylight, and that at early dawn the fishermen would come off to examine the nets.

"They bear the Dutch, I am sorry to say, no good

will," he observed. "We are accused too justly of laying the produce of their industry under tribute; but they will respect you as an Englishman, and for your sake save the lives of both of us. Till I found that you had escaped, I was very anxious on that score."

As I have said, we talked continually, for silence was painful, as I could not tell when my companion's voice was silent whether he had been drawn down suddenly by a shark, or had sunk overcome by fatigue. Even with conversation kept up in this way, the time passed very slowly by. How much worse off I should have been alone! At length Van Deck exclaimed that he saw the dawn breaking in the sky. Rapidly after this objects became more and more distinct: the tall bamboo buoys, with their tufts of dry grass at the top, floating on the glassy water; then I could distinguish my companion's head and shoulders just above the surface; and the land about two miles off, on which, however, a surf broke which would have made landing difficult, if not dangerous. The tall trees and the mountains, range above range, seemed to rise directly out of it.

Soon the fishermen's voices, as they pulled out, singing in chorus, towards their buoys, greeted our ears. Two boats came close to us. The fishermen exhibited much surprise at finding us, but instead of at once coming up and taking us on board, they lay on their oars, and appeared to be consulting what they should do with the strangers. How the discussion might have terminated seemed doubtful, had not Van Deck told them that I was an Englishman, whose countrymen had just conquered the island; that he was my friend; and that if any harm happened to us my people would come and cut off all the people in the district, whereas if we were well treated they would be munificently rewarded. This address, which taken in its oriental meaning was literally true, had the desired effect: one of the boats approached me. As the Javanese took my arms to lift me out of the water, I felt that I could not have held on another minute. Immediately that I was in the boat I fainted, and I believe that my friend was much in the same condition. He, however, quickly recovered, and by the promise of an increased reward induced the fishermen to return at once to the shore. I did not return to consciousness till I found myself being lifted out of the boat and placed on a litter of wicker-work. Van Deck was carried in the same way, as he was too weak to walk. We were thus conveyed to the house of a chief, who resided not far from the shore, built on the summit of a rising ground overlooking the sea.

The chief, who was every inch a gentleman, received us with the greatest hospitality, and, seeing what we most required, had us both put into clean, comfortable beds in a large airy room, where, after we had taken a few cups of hot coffee, we fell asleep, and did not awake again till the evening. Our host had then a sumptuous repast ready for us, of which by that time we were pretty well capable of partaking. Poor Van Deck was naturally very much out of spirits at the loss of his brother, but the necessity of interpreting for me kept him from dwelling on his own grief.

Now let me speak of the natives of Java. From what I saw of them, I formed a very favourable opinion of their character. They are intelligent, industrious, brave, and honest. Under a good government much might have been made of them; but, warm as is my regard for many Dutchmen, and for Holland in general, I am bound to say that the Dutch colonial system is the reverse of good. The colonial government is tyrannical and oppressive, and too many of its officers are unscrupulous and oppressive. The people are over-taxed

and ill-treated in every possible way, to such an extent, indeed, that they have been driven in their despair to take up arms, in a vain attempt to regain their liberty, and have suffered severely in consequence. The Dutch officials go out to Java with the one sole object in view of making money—honestly, if they can, but to make money. Soon after the capture of Java by the English, the enlightened Sir Stamford Raffles, the founder of the now flourishing settlement of Singapore, was sent out as governor. He at once instituted a system perfectly different from that of the Dutch. His great aim was to grant their rights to all classes of men, and to allow them the most perfect freedom in all their business transactions. The result of this enlightened system was that the Javanese paid the British government the most perfect and willing obedience, and showed that no dependency of the crown could be so easily and happily governed. Sir Stamford Raffles also made numerous tours throughout the island, and convinced himself, from its numberless and valuable natural productions, of the immense amount of wealth it was capable of affording. All this information Sir Stamford carefully remitted to the government at home; but it is asserted that so indifferent were the ministers of the crown in those days to the far off colonies of the empire, that his despatches were not only not read, but actually not opened! And thus when after the termination of the war the territorial acquisitions of the various belligerents were readjusted, unhappy Java was delivered up to the Dutch without the slightest regard to the interests of the inhabitants or any stipulation that the rights granted to them by the English should be held sacred. The consequence was that the old tyrannical system under which they had before groaned was speedily re-established.

It must have been a heart-breaking thing to Sir Stamford Raffles, when after six years of labour he saw the people in whom he had taken so great an interest, delivered up to their old oppressors. He must have had the satisfaction, however, of feeling that for those six years he had benefited them very greatly, and also that he had established, during his government of the British possessions in the eastern seas, the most flourishing city in that part of the world.

At the time of which I have hitherto been speaking, when I was in the east, the spot on which Singapore, with its streets of stone palaces, its superb public edifices, and rich warehouses, now stands, was a sandy flat, with a few straggling huts inhabited by fishermen or pirates. I am about to give a piece of history posterior to my voyage as a supercargo. After the peace of 1814, when Java and its dependencies were given, as I have mentioned, up to the Dutch, their first act was to impose restrictions on British commerce in the Archipelago. They were enabled to effect this object from the position of their settlements, those in the straits of Malacca and Sunda commanding all the western entrances to the China and Java seas, and it therefore became evident that without some effort to destroy their monopolies, the sale of British manufactures in the eastern islands would soon cease. Sir Stamford Raffles, who was at that time governor of Bencoolen, represented the case so strongly to the Supreme Government at Bengal that the Governor-General gave him the permission he asked to make a settlement near the north-east entrance of the straits of Malacca. He accordingly, in the year 1819, fixed on Singapore, which stands on the south side of an island, about sixty miles in circumference, separated by a narrow strait from the Malay peninsula. Of course the establishment was

opposed by the Dutch, who so strenuously remonstrated with the British Government that the latter declined having anything to do with it, and threw the whole responsibility on Sir Stamford Raffles. It was not until it had been established for three years, in the last of which the trade was already estimated at several millions of dollars, that Singapore was recognised by Great Britain.

However, I must return to my journal. After a rest of a couple of days, poor Van Deck and I were sufficiently recovered to commence our journey back to Batavia. He was anxious to be there that he might take charge of his late brother's affairs—I, that I might report the loss of the brig, and make fresh arrangements for securing a cargo for Sydney. We met with no adventures worthy of note on our journey, and I am not writing a Java guide-book. I can say, however, that I saw enough to convince me of the wonderful fertility of the soil and the vast internal resources of the country, and I could not help feeling considerable satisfaction that England had obtained so splendid an acquisition.

On our return to Batavia, much sympathy was excited for my friend Van Deck among the merchants at the loss of his brother, and the naval commander-in-chief, returning soon after from Sourabaya, despatched two frigates and a brig of war in search of the pirates. They were supposed to belong to some place on the coast of Borneo, which has for many years abounded with nests of these desperadoes. The fleet in question was supposed to belong to a famous chief, the very idol of his followers on account of the success of his expeditions. His title was the Rajah Raga, and he was brother to the Sultan Coti, a potentate of Borneo. The Rajah Raga had subsequently some wonderful escapes; for he probably got due notice that an English squadron was looking after him, and took good care to keep out of their way. He was afterwards cruising with three large prahus, when he fell in with an English sloop-of-war, which he was compelled to engage. Two of his prahus, by placing themselves between him and the enemy, held her in check a sufficient time to enable him to escape, and were themselves then sent to the bottom; indeed, they must have expected no other fate. On another occasion the rajah remained on shore, but sent his own prahu, which carried upwards of a hundred and fifty men and several large guns, on a cruise, under the command of his favourite panglima, or captain. Falling in after some time with a brig merchantman, as he supposed, and wishing to distinguish himself by her capture, he fired into her, and made preparations to board. Great was his dismay when he saw a line of ports open in the side of his expected prize, and he found himself under the guns of a British man-of-war. The panglima hailed, and with many apologies tried to make it appear that he had acted under a misapprehension; but his subterfuge was of no avail: a broadside from the man-of-war sent his vessel at once to the bottom, and he and all his crew perished, with the exception of two or three who, clinging to a piece of the wreck, were picked up by a native craft, and carried an account of the disaster to their chief. Piracy has been the bane of these seas for years, and will continue to be so unless repressed by ships of war kept constantly on the alert to punish transgressors. Whenever the ships of war are absent, it again springs up as active as ever. So it will continue to be the case until true religion, civilisation, and commercial enterprise are established firmly among the inhabitants of these fertile regions. The Dutch missionaries are, I understand, making some progress in spreading the truths of the Gospel among

the people of Java and its dependencies, but there is a wide field for missionary enterprise in these regions, as yet comparatively little worked.

We were fortunate in obtaining the full amount of the goods we required without having to wait much longer at Batavia. There is an old proverb, "It is an ill wind that blows no one good." The vessel for which they were intended had lost her master and both mates by sickness, and the merchant therefore sold them to me. We had not altogether escaped, and several of our men who were perfectly healthy when we entered the harbour fell victims to the fever engendered by the pestiferous climate. We were compelled to fill up their places with others, who afterwards gave us much trouble.

It was with sincere regret I parted from my friend Van Deck. I was glad, however, to find that he was likely to obtain employment suited to his talents under the English government. The most direct course for New South Wales would have been through Torres Straits, but the east trade wind still blowing, compelled us to take the longer route round the south of New Holland, and through Bass's Straits, not many years before discovered, between that vast island and the smaller one of Van Diemen's Land. A northerly breeze at length coming on, enabled us to sight the south-west point of New Holland, and thence we sailed along the coast, occasionally seeing tall columns of smoke ascending from the wood, showing the presence of natives.

On approaching Bass's Straits, the captain was one day expressing his regret to me that we had not time to anchor off one of the islands in it to catch seals, great numbers of which animals frequented the place in those days. He had known, he remarked, considerable sums made in that way in a very short time. Our conversation, it appeared, was overheard by one of the men we had shipped at Batavia. We had had a good deal of insubordination among the crew since we left that place, and we traced it all to that man, Miles Badham, as he called himself. He was about thirty, very plausible and insinuating in his manner, a regular sea-lawyer, a character very dangerous on board ship, and greatly disliked by most captains. He had managed to gain a considerable influence over the crew, especially the younger portion. His appearance was in his favour, and in spite of the qualities I have mentioned, I would not have supposed him capable of the acts of atrocity which were with good reason laid to his charge. Ben Stubbs, the second mate, had charge of the deck one night, and, unable to sleep, I was taking a turn with him, when Mr. Gwynne, the surgeon, came up to us. "There is something wrong going on among the people below," he whispered; "I cannot make out what it is exactly, but if we do not look out we may possibly all have our throats cut before morning." "You must have been dreaming, Gwynne," answered Stubbs; "there isn't a man in the ship would dare do such a thing." "I am not certain of that," I observed; "at all events, let us be on the right side. Fore-warned, fore-armed. We will let the captain know, and I trust that we may thus defeat the plot, whatever it is."

TRAMPS AND VAGRANTS.

BY A COUNTRY CLERGYMAN.

My house is situated in the suburbs of an agricultural town, containing about ten thousand inhabitants. The

high road from a much larger and more important place passes by my gate, and leads to a fashionable watering-place much resorted to in the summer months. As every roving tramp, who enters Fairmead from the side on which I live, has had a walk of some twenty miles, with very scanty opportunities of foraging in the scattered villages, few and far between on the main road, he naturally approaches our town with a sharpened appetite for doing business. The neat Elizabethan style of my residence possibly suggests to the observant begging fraternity that it is the vicarage; and to that circumstance I am very likely indebted for many visits I should not otherwise receive; for it is not usually the practice of the tramp to beg from house to house, as he enters a strange place. He will pass by the most tempting suburban villas, as if he had no designs whatsoever upon their occupants. But he knows perfectly well what he is about. Meanwhile, it is always a safe move to try it on at the vicarage; and so I have noticed that tramps will turn in at my own gate, who postpone their calls upon my neighbours until they have learned a little more about them. Such experience as I may have gained, under these circumstances, after having been taken in, times not a few, I am most happy to communicate.

I have often wondered what relation the tramp roaming the country bears to the sharp practitioner of the city. Have we the same man, occasionally indulging himself with a sniff of country air and a view of the green fields, whom we see by-and-by pursuing his trade in the large town? Sometimes I think that the town and the country tramp are one and the same species; at other times I feel persuaded that they are totally distinct. A genuine tramp can sleep anywhere. There are very few nights in the course of the year which are too inclement for him to lie under the shelter of a stack, or creep into a barn or outhouse. He wants plenty of air, and the close putrid atmosphere of a metropolitan lodging-house would be, as an ordinary rule, more than he could endure.

In illustration of this last remark, a very curious incident comes to my recollection. A man and a woman were approaching Fairmead late in the evening, in the month of November. They had walked some fifteen miles since the morning, when the man was taken so ill that he fell down in the road. His companion helped him through a gate into the nearest field, and left him under the hedge whilst she went forward to Fairmead to get assistance. His illness proved to be a bad case of small-pox. As there happened to be an empty shed within a few yards of the place where the man was lying, he was removed there with the consent of the owner; a stove was fitted up and a door put in, and plenty of fresh straw and clean bedding were forwarded by the parish authorities. In fact, in the course of twenty-four hours, the outhouse was made to assume the appearance of great comfort; and the medical man was unremitting in his attentions.

When the disease had reached its crisis, the doctor left his patient one evening, with serious misgivings as to the turn the malady might take. He by no means felt any confidence that the man would recover. He went, accordingly, the first thing the next morning, to see how matters were going on, and to his astonishment he found that both the man and the woman had disappeared. It was a raw cold morning, and a drizzling rain had been falling the whole night. Looking round, he noticed the woman's bonnet lying on the floor, and presently he observed that the blankets were gone. It occurred to

him then that they could not be far off. After a short search he found both the man and the woman fast asleep under a hedge, with the blankets they had taken from the shed wrapped around them. The woman told the doctor, in explanation, that her husband was so unaccustomed to sleep under a roof, that he complained he could not get breath; and so, at his urgent request, she had removed him into the open air. Strange to say, he began from that night to improve rapidly, and in a few days was able to resume his wandering life.

It is estimated that there are no less than thirty thousand vagrants in this country moving about from place to place. They would decline the best situation, and sacrifice the fairest prospects, rather than devote themselves to any fixed industrial occupation. Their peculiar study, therefore, is how to get a livelihood under the condition of never being at rest. This, I take it, is the reason why the tramp apparently neglects the better class of houses as he enters the various towns which lie in his route. He is an economist of his time. He has no inclination for an unnecessary expenditure of trouble. He pursues his way, therefore, at once to the lodging-house, which is his house of call, where all the special information he is in want of is to be obtained. In some of these places it is said that regularly prepared schedules are kept, containing the names of the most kind-hearted and charitably disposed inhabitants. I have been told that the report of a local charity was found in one of these houses to be extremely serviceable. All I can say is, that if the wandering fraternity do make use of published reports to aid them in their enterprises, they are not peculiar in so doing; as any one will know who has his name down in any professional or charitable list to which the innumerable writers of circulars and publishers of other printed matter have access. The tramp's information, however, is chiefly communicated by word of mouth. Each one is ready to tell all he knows. He has no secrets and no jealousies to prevent him from proclaiming what the exploits and successes of the day have been. He is off to-morrow, or the next day, and it will be a long time before he comes the same way again. He has no motive, therefore, for keeping it close where he has done well, or by what means he managed his little game. And if those who have given, and those who have refused to listen to him, could respectively hear how they are alluded to during the evening, they would find that the latter come in for far more complimentary language than the former; for the tramp seems to have much more real respect for the shrewdness which sees through his dodges, than for the soft-heartedness which is duped by his hypocrisy. "It's no use going to that spot, he is a wide-awake cove;" this on the one hand, and on the other, "Try it on there by all means, he's jolly green."

As late as half-past nine o'clock one evening a woman called at my house with a most pressing request, that I would allow her to see me only for one minute. Her story was, that she lived in a neighbouring village, and that she had just arrived in Fairmead by the last train, intending to proceed to Liverpool by the Government train the next morning. Her fare to America, whither she was going to join her son, was already paid; but she had just discovered that she was three shillings short of the sum needed to pay her railway expenses; and she had nothing wherewith to provide herself with a lodging that night: would I have the kindness to lend her four shillings? She had friends in the village she came from, who would gladly repay me. She would be so thankful if I could help her in her difficulty, for she did

not know what in the world to do, she had never been in such a situation before. Now, what can one do under such circumstances as these? Your petitioner has managed, with much adroitness, to throw the full responsibility of her case upon you. Her passage money is paid; her friends have aided her in getting her outfit; her son, on the other side of the Atlantic, is awaiting her arrival. If her tale be a true one, it would be a hard thing to entail upon a respectable woman so much loss and such heavy disappointment, when it is in your power to help her with a small loan; and if, on the other hand, her story be untrue, you have no means of detecting the imposture, except by turning out at a late hour of a comfortless night to pursue the investigation. After a careful cross-examination, which failed to detect a single weak point in the woman's statement, I lent her the small sum she named; and I was so won over by her respectable demeanour, that when she withdrew I wished her a prosperous voyage, and a happy meeting with her son. Need I say that she was a clever impostor, and that I found out by subsequent inquiries that no such person was known in the village from which she professed to come? I resolved, in consequence of this imposition, that I would never be taken in after that fashion again, and especially that I would listen to no applicants who chose a late hour in the evening as the time to honour me with their acquaintance. Not long afterwards, however, another case occurred which showed how the wisest resolution will yield under artful management. In this case it was "a broken-down medical man" by whom I was victimised. The story was so ingenious that I was completely taken in, and to an extent that gave a permanent lesson of caution.

I can now venture to recommend a course of action with respect to vagrants which I have frequently tested and never found it fail. Whereas I was at one time pestered by these wanderers, I am very seldom honoured by a visit from them now. This is my practice. Whenever a stranger makes his appearance, and I perceive that his object is begging, I take care to be the first to speak:—

"Are you a Fairmead man?"

"No, sir."

"Then I must wish you good morning."

Sometimes this summary way of breaking off the interview draws forth a muttered curse or a volley of abuse, and then you can have no question in your own mind that you have acted wisely. But, not unfrequently, your petitioner will withdraw with a meek, pained, disappointed look, and this is more trying. It makes you doubt, whether you may not have turned away a deserving object from your door. It is quite possible, I acknowledge, that some poor, down-hearted creature may any day present himself before you, and may watch your countenance with the eagerness of real destitution to see if there be mercy there to give him hope that his supplication will not be in vain. This is a supposable case, but one I am convinced that happens very rarely indeed. I was on the point of calling back a most forlorn object one day, feeling that I had acted with harshness in not listening to his story. He had turned quietly, but sadly, away, and crawled, as if in great suffering, down the path. But when he arrived at the gate, he turned round and gave an evil, threatening look towards the house, and then wrenched the gate open and swung it upon its hinges with as much violence as he dared employ, evidently hoping in his spitefulness that he might do some injury.

But the truth is, if we adopt the rule of never giving to beggars, we ought to do it on the principle of having

already done our duty to the full amongst those who have a genuine claim upon our compassion. If we own the obligation resting upon every one of us to show mercy to the poor, the sick, the unfortunate, and to search out those who are really deserving and help them, we need feel no qualms of conscience about some possible case of wretchedness over which there always hangs the suspicion that it may be an imposture after all. Systematic charity, exercised towards our less fortunate neighbours, is the true antidote against vagrancy. It is a moderate computation that six hundred thousand pounds are levied annually to support the restless host who beg from town to town, and from village to village, from sunrise on January 1st till sunset on December 31st. They earn nothing, they create nothing, they produce nothing, and yet they live well, with occasional privations when they have a run of bad luck.

The professional beggar trades upon that weakness which indisposes us to meet him promptly with a decided refusal. We do not care for him; we do not respect him. He is a nuisance, and we would gladly be rid of him. We call in the aid of the constable to keep a sharp look out upon him. We are not sorry when we hear of his being put in the lock-up. And yet, for all this, we supply him with means, and extend to him the charity which alone enables him to follow his idle calling.

Speaking from my own experience, I have said that the rule of promptly refusing to listen to a stranger, unless he can say that he is resident in the place, and so gives you the opportunity of investigating his story, effectually relieves you of their attentions. I have verified the soundness of this assertion by frequent experiments. If you have not had a vagrant at your door for weeks, you can make sure of half-a-dozen any day you feel inclined to make the experiment.

I found this out in the following manner. Contrary to my usual practice, I entered into conversation with a man who was coming towards the house along the garden walk. His first word proclaimed him an Irishman, and it was owing to his native fluency of speech that he got on a good way into his story before I had the chance of stopping him. He was a discharged soldier and had served in India. It was the mention of this latter circumstance that made me feel interested in, and therefore disposed to listen to, his narrative. He had been in several parts of that country, where I have friends and relatives. All that he told me was undoubtedly true. So, after talking with him for some time, he received a gratuity, which evidently struck him as being rather handsome.

"And now, my good fellow," I said, "please don't go and tell all the world that I have given you anything; but I was interested in what you said about India."

"An' your honour may depind upon it, I'll not mintion it to a sowl; as shure as me name's O'Reilley."

Walking down my garden a few minutes later, I smelt the fumes of tobacco, and I heard voices just beneath the sunk fence, with its hedge of dwarf yew-trees, which borders the high road. And this is what I heard:—

"His honour's a gintleman intirely. I towld him me story, I did, an' he gives me this"—exhibiting, I suppose, the coin I had given him. "Shure, an' he did—that's truth."

This is how Mr. O'Reilley kept his word. And if his sense of gratitude was so overpowering within so short a time of promising that he would not "mintion it to a sowl," it is easy to guess how communicative he

would become when he came to spend the evening amongst his comrades, with whom it is a point of honour to enumerate for the common weal all the good things they have dropped in for during the day. Within twenty-four hours of receiving the honour of Mr. O'Reilly's visit, some six or seven applicants favoured me with a call; but as I sent them away empty, the stream subsided almost as suddenly as it had risen.

With one word more of caution, the result of dear-bought experience, I conclude this paper. Never parley with a tramp; let the direct inquiry, "Are you a Fairmead man?"—which admits of only one answer, yes or no—begin and end the interview. If he says Yes, then you ask, "Where do you live?" Having been satisfied on this head, you can reply, "Very well, I will call upon you at your house:" and in the meanwhile you have full leisure to investigate the circumstances. But if the answer be No, then you decline to say anything more. But be sure that you are firm. You are certain to be outwitted if you stay and listen to a single sentence. Your opponent has carefully studied his part, and has perfected it by a thousand rehearsals. You think, it may be, that you detect a flaw in his plausible story, and you are down upon him in a moment with the most impolitic impetuousity. But he has an explanation at hand which entirely disposes of your anticipated advantage. And then follows the natural termination of the interview, upon which he has quietly counted from the commencement; you hand him over a gratuity in order to get rid of him.

Every one who parleys with a professional beggar courts defeat. A friend of mine told me the other day, that his practice is to hand over to the vagrant who presents himself at his door, what he called a "regulation penny." "I never listen," he explained, "to what they have to say. I give them a penny, and tell them that if they get as much at every house they will do well." I ought to add, that my friend is not much troubled by these gentry, but still, I would venture to suggest that it is a wrong principle. It does something, although it does not do much, towards maintaining a bad system. It overlooks the important rule, that our charity ought to be bestowed where we have strong reasons for believing that it is being well bestowed. It may be convenient to rid oneself of a nuisance on such easy terms, but it does not satisfy our ideas of duty. In the same manner, people have said to me, "We never give money, we always give victuals at the door." They do not know what a trade is carried on in these self-same victuals. Lodging-house keepers' pigs are amongst the fattest in the land; and no wonder, for they live upon the choicest food, such as no nobleman would dream of throwing to his swine. You imagine that you are mercifully feeding the hungry when you dispense to some famishing applicant a few slices of good white bread with butter spread upon it, or a piece of meat or bacon to make it more palatable; but you are not aware that your mendicant carries a wallet, and that the "swag" he may chance to collect in his day's rounds has its fixed price with the lodging-house keeper, and finds its way to the pig-tub in return for something warm and savoury for supper.

"What have you got there, my man?" said our superintendent the other evening to an ultra-economical tramp who applied for a night's lodging at the vagrant ward with a large bag well filled with broken victuals,—"What have you got there?"

"Only some bread and meat," was the reply.

"What are you going to do with it?"

"Eat it, to be sure; what else should I do with it?"

"Nay, my lad, that story won't do here. We don't find lodging for such as you when you've enough to pay for a bed and breakfast into the bargain."

This question—how to deal with vagrants—is a very important one. I have endeavoured to show that the recipients of our indiscriminate charity are demoralised by the alms we bestow. They trade upon the indisposition of the public to refuse them assistance; when they can, they contrive to get a hearing. This drives them to all kinds of shifts and expedients to excite compassion. It is the business of their life, therefore, to study and to practise deception. They are utterly careless of truth, if a falsehood will serve their purpose better. A person representing himself as author of well-known writings, lived for many weeks this year in London by calling on clergymen, editors, literary men, and others, with a false tale of woe. He had lost his purse, and wanted enough to convey himself and a sick sister to Huntingdon. He always paid his visit late in the evening, when "offices and houses of business (where he could have got the money) were closed." The chances of being found out are small, the gains of a well-sustained imposture are large. And yet the public are successfully imposed upon, because each man fears that he might possibly be turning a deaf ear and giving a hard-hearted denial to some case of genuine distress. The long and the short of the matter is this, we are victimised because conscience is not satisfied that we have done our duty towards the poor and needy. The remedy, therefore, is evident. Ascertain what you can and ought to give for the relief of the necessities of others. Distribute personally what you are able, and dispense through recognised channels what you cannot personally administer. And then with a clear conscience you can say to all whom it may concern, "No, I have nothing for you, I have already given as much as I can afford."

Whatever the Legislature may find it necessary to enact to cope with this gigantic evil, as it presses itself upon the attention in large towns, it is a good and wholesome principle never to give one penny to any member of the flying column of idle vagrants, ever ranging the country and living upon its resources, whilst truer, better, and more responsible folk are pining in the cold shade of our neglect.

A LADY'S JOURNEY THROUGH SPAIN.

CHAPTER VIII.—RONDA.

WE were much divided in opinion as to our onward progress. We were all agreed that we wished to arrive at Seville before the end of July. Our stay at Granada had been longer than we intended, and we had continued to linger on our way, both at Velez Malaga and at Malaga, till the month was farther advanced already than we wished. Still we could not have enjoyed ourselves more entirely than we had done hitherto, and we certainly were not hampered as to time for our further proceedings. So we determined not to be annoyed if we reached Seville later than at first intended; and forthwith resolved not to forego a short expedition from which we promised ourselves much enjoyment, namely, the ride from Malaga to Ronda, and thence to Gibraltar. We were assured that if we took provisions with us we should find no difficulties worth speaking of; and that by starting at daybreak, resting during the great heat of the day and then going on again in the beautiful nights, we should avoid any inconvenience.

I was fortunate enough to be a very fair Spanish

scholar when I started; and certainly a great deal of enjoyment I obtained from the curious narratives with which our muleteers would beguile the way during some of our long mountain rides. Their endurance of fatigue is a characteristic of these men; they never seem to think of themselves, and they show a sort of chivalrous regard for the comfort of the ladies of the party. They are popularly called *Arrieros*. Their dress is very picturesque. Many of them in former times were known to have saved a great deal of money, and they were much sought after as husbands by the fair ones they met on their different journeys. They were not always supposed to be patterns of constancy, but the roving life they led rather threw temptation in their way; and here a sprightly Andalusian, there a Maja in her fanciful costume, or perhaps some beauty of Malaga, full of soft bewitching grace, would lay dangerous siege to the affections of the hapless muleteer. If, in spite of all these blandishments, he remained true to his first love, some Spanish peasant girl in his native village, he might be deemed worthy of all praise.

We made a long day from Malaga to Ronda, as there is literally no place where it would be possible for ladies to spend the night between the two places. The road leads through the beautiful and extensive plain surrounding Malaga, previous to entering upon the wild mountain defiles that succeed each other the greater part of the way to Ronda. The hamlets are as savage and gloomy in their aspect as the scenes that surround them; and for the first time since we entered Spain the weather was not as propitious as usual. We had heavy storms of rain, and we were glad to wrap ourselves up in all the warm garments we had at hand, for the mountain air during these storms seemed to pierce through and through one. Still we did not quarrel with the change, for we were compensated by the grand effect of mingled storm and mist and sunshine on the wild and stupendous scenery around us. The people of these mountains are the finest that we saw in Spain, and the contrabandista of Ronda is the beau ideal of a roving mountaineer. The stories related of their prowess, their daring, their clever stratagems, and their numerous smuggling adventures, are endless; many I wrote down at the time, so much was I struck by them.

The approach to Ronda is most striking. It stands on a steep rock, with a rapid river washing the base of it, and the road up to it is so steep that I should have been very unwilling to have attempted it in a carriage of any sort. Our sure-footed steeds made no difficulty about it, and a succession of fine views delighted us during the ascent. It is a curious place, both as to situation and as to its population; it was, some little time ago, the head-quarters of the contrabandistas. Even now the inhabitants consist largely of smugglers, young men in training for the bull fights, and the mountaineers of the district of Ronda; and it may be some characters not quite so respectable resort thither. There is a curious abyss between what is called the old and the new town. The Guadalvin (or deep stream) is the name of the river encircling the town. The old Moorish castle and the Moorish mills low down in the valley are very picturesque. Nothing I have seen is more striking than the bridge which crosses the chasm, as seen from these mills; it seems as if it was suspended in the clouds, the elevation is so great, between six and seven hundred feet above one; and the beautiful river emerging into light and sunshine from the rocky defiles it has struggled through, looks like burnished gold in the dazzling light, as it falls down

from rock to rock before it reaches the valley. It was a glorious scene, and in picturesque and beautiful Moorish remains altogether more striking than any spot I visited during my stay in Spain.

One perfect gem of a Moorish house is situated in the Calle San Pedro. A ghastly legend is related in connection with it. It is stated that it belonged to El Rey Moro Al Motadhed (the Moorish King Motadhed), who drank his sherbet or iced drinks out of cups formed of the skulls of those whom he had himself beheaded. It is said that these horrible goblets were adorned with costly gems and with rubies and emeralds; and that diamonds glittered in the empty sockets where formerly dark eyes might have flashed, and that pearls were arrayed side by side in mockery of the teeth once there.

Ronda is better worth seeing than many places of far greater celebrity. There are very fairly comfortable inns there: indeed we were so well satisfied, and found so much to engage our attention, that we prolonged our stay for four days, and would willingly have lingered on, but for the reasons already given. The peasant girls at Ronda put one greatly in mind of Murillo's pictures; they have the sunny brightness of complexion in which he delighted, the bright colour, the splendid black hair with a sheen on it, the laughing black eyes, and the same roundness of form, with the well-shaped hands and feet. The mountain breezes at Ronda prevent all enervating effect from the heat, and it is reckoned very healthy. They have a proverb to this effect: "*En Ronda los hombres à ochenta son pollones*" (At Ronda old men of eighty are but chickens). The people are devoted to their bull fights, and there is a very fine arena for these spectacles, probably unrivalled as to its situation; it is near the edge of the precipitous rock, and commands the whole beautiful view of the abyss below, the rocks, and mountains, and valleys. The fruits and flowers are plentiful and most delightful, and the Alameda is one tangled mass of the most beautiful roses. We were too late to see the fair, when Ronda puts forth all her attractions, and Spanish peasants and Spaniards of the middle classes flock thither from all the neighbouring parts. We decided to let our horses remain at Ronda, and we hired some excellent horses of the country, small but very strong and active, for our ride to Gibraltar. We had already tried them in different most delightful excursions from Ronda which I have not time to dwell upon.

Our object was simply the ride, for we had all seen Gibraltar thoroughly many years ago, but we were told that the whole aspect of the towns and villages on the route, even to their very names, were more entirely Moorish than any other district we had seen. Most certainly the peasantry are far more Eastern in their aspect than European, and the situations chosen for the villages reminded me forcibly of what I had seen in the East, where they erect their abodes frequently on inaccessible rocks all clustered together in an incredibly small space. I could indeed have fancied, when such names as Benarraba, Benadad, and Bendalida sounded in my ears, that I had suddenly been transported to the East; but the industry the peasants show in cultivating every available spot of ground on the mountain sides is like anything but Eastern indolence. We made two days of the ride, sleeping the first night at Gaucin. Here, as usual, there is a castle with a splendid view from it. The descent, the following day on leaving Gaucin, was really tremendous; it is a descent down an apparently impassable wall of rocks which form a barrier as it were to Granada. I do not know that my

nerves were ever more severely tried, though the horses are so surefooted that one rarely hears of accidents, and it is only the aspect of the awful precipice that is

freshed our sight. The sight of some lonely shepherds armed with slings similar to the one used by David in his combat with Goliath, brought curious associations

RONDA.

alarming. It is the grandest part of these mountain defiles, and most lovely it is to pass from this chaotic mass of the most rugged and magnificent mountains into a very Garden of Eden. Orange groves growing along the banks of the Guadayo—oleanders, with their gorgeous crimson flowers glowing in the richest profusion—and, as we advanced towards San Roque, after crossing the picturesque ferry of the Xenar, the most luxuriant woods of chesnut-trees and cork-trees re-

to our minds, and carried us far back to other times. The Spanish shepherds use these slings in the management of their flocks.

San Roque, as my readers are aware, is the Spanish town that was built by the Spaniards after their loss of Gibraltar. It was a singular way of seeking to compensate themselves, making a settlement actually within sight of the conquered fortress, so that their loss must have been for ever before them. We did

not wish to enter Gibraltar, so we took up our quarters at Macre's Hotel, where we really fared very well, and the rest after our fatiguing ride was most agreeable. We had English friends at Gibraltar, who kindly came to us at San Roque, and we had been so long banished from English newspapers and English friends, that the time passed only too rapidly in the enjoyment they provided for us.

We were to complete our riding tour by riding to Xerez, whence the distance was but trifling to Seville. The valley of the Guadayvo is delightful; thick groves of walnut and chesnut, and extensive orchards of almond-trees, extend everywhere. A most striking sight greeted us on our way, which made a deep impression on some of the party. I have already alluded to the wayside crosses often erected in commemoration of some fearful deed perpetrated on the spot, and I spoke of the deeply tragic character these memorials gave to the scene where they were placed, but I leave my readers to imagine what must have been our feelings when we came in sight of eight of these memorial crosses all clustered in a very small space. Our guides had taken care to tell us that the defile we were entering was a most notorious resort of robbers, and that not so very long ago; but the band had been broken up and the chief executed for a most fearful murder committed on an unfortunate old man and his daughter, wealthy people travelling without sufficient precautions, and it was supposed with a large sum of money, but that never was heard of again. These dreary crosses, looking dark and ominous, seemed to threaten the passer-by with some fearful doom, stretching out their long arms in different directions, as many of them were placed at right angles with each other. These crosses each bear the name of the person who was murdered on that spot, with the date; and it is the custom with the Spaniards when they come within sight of these crosses to halt and offer up prayers for the repose of the victim cut off in so fearful a manner. They make upon the passing traveller an unpleasant impression; but the succession of striking scenes after a time brought brighter and pleasanter thoughts. Nothing can be more mountainous than the route, and often and often we regretted that none of our party were able to carry away sketches: as far as the landscape was concerned, it would have required the genius of Salvator Rosa to do justice to its grandeur and magnificence; but most effective drawings might have been made of many of the women that we saw. Anything more strange and weird than their looks I have never seen; the very sight of civilised human beings, especially ladies, seemed so strange to them, that when we halted they clustered round the horses, coming as near as our guides would allow, and gazing at us with their glittering eyes. Their hair all flowed in tangled locks about their heads, their dress was the oddest mixture of bright colours and strange hues that ever were brought together. They were not so much Eastern as thoroughly African in their appearance, and I could imagine many of them being quite ready to aid brothers or husbands in any daring exploit whatsoever. The pass over the mountain, called San Cristobal, is very steep and lofty, and rarely free from snow on the summit.

We were quite glad after our fatigues and the excitement we had experienced, to find ourselves at the tidy little posada, or inn, where we intended to pass the night, and thought with increasing pleasure of our near approach to Seville. The following day the scenery changed completely. We came to a smiling luxuriant district, where fruits, flowers, and verdure vied with

each other in displaying their varied beauties, bright rivers refreshed the thirsty earth and watered the lovely gardens with their welcome streams of ice cold water! Pine woods afforded most delicious shade and coolness, and presently we reached Arcos, situated, as are all these mountain towns or villages, on almost inaccessible heights. The awful precipice that skirted the road nearly took one's breath away, and would have caused even greater fright but for the diversion of the Andalusian costumes here seen in all their graceful beauty—the veritable Majos and Majas; each peasant, male and female, forming a striking object from the singular national costume that they wear. We had, from this strange spot, a farewell and most magnificent view of the Ronda mountains. A short rest and then we made the best of our way to Xerez.

THE ORDNANCE SURVEY.

SURVEYS, in the land valuator's sense of the term, are no new things. Doomsday book was a record of land, describing with minute accuracy the plots, their value, tenure, crops, and stock. Nor are surveys, in the astronomer's or geographer's sense, marvels, the ancients having left us charts and maps of no mean value. But with the advance of science, settlement, and the arts, refinements became necessary; even the surveys of a few years ago have been deemed insufficient for the requirements of the present day.

Thus it is that the Ordnance Survey has grown into its present form. Its history we would now outline. The immediate origin of the Ordnance Survey may be traced to the desire, in 1783, of connecting the observatories of Paris and Greenwich. In the following year General Roy, R.E., measured a base, and commenced that triangulation which has since extended over the United Kingdom.

On the accuracy of a base of any survey depends that of the whole work, so that the utmost niceties are resorted to in its measurement, and as a check upon even that base, it is usual to measure other bases at remote distances, and connect them for comparison by a series of triangles. The first base measured in England was that on Hounslow Heath in 1784. For this were tried at first steel chains, then deal rods, twenty-three feet three inches long, tipped with metal, but the hygrometric changes of the atmosphere were found to affect this length sometimes to the extent of one-fifteenth of an inch, which would have made a difference of more than seven feet in the whole length of the five-and-a-half mile base, fatal to the accuracy aimed at. Glass rods were next used with great improvement. Their result against that of the steel chain showed only a small difference.

The operation of measuring this base was watched by the president of the Royal Society, and by many of the leading men of the day, and honoured upon one occasion by the presence of his Majesty George III. Other bases were measured about the same time, including one on Salisbury Plain in 1794.

About 1828 a vast improvement was introduced into measuring apparatus: compensation bars were invented. These are not easy to describe without drawings, but it may be mentioned that, by a self-adjusting process, they avoid showing any variations in length from change of temperature. With these compensation bars a new base, ten miles long, was measured near Lough Foyle, in the north of Ireland, in 1848. These tests upon previous work are as satisfactory as they are instructive.

The results of the measurement of the Salisbury Plain base stood thus :—

Measurement with Ramsden's steel chain, 1794 . . .	36,575·64 feet.
" with Colby's compensation bars, in 1849 . . .	36,577·95 "
Computed by calculation from Lough Foyle base . . .	36,577·34 "

A result equally beautiful and illustrative of the general excellence of the instruments and work of the British triangulation.

Hounslow Heath measured when reduced to the—

Ordinance standard, with glass rods, 1784 . . .	27,405·06 feet.
Ditto ditto with steel chain, 1791 . . .	27,405·38 "
Deduced by computation from Lough Foyle base . . .	27,405·83 "

A result which may be considered unparalleled in geodesy, when the extent of the triangulation intervening between the two bases is considered.

The delicacy of the operation of measuring a base cannot be here described, but its labour may be inferred from a few details. For instance: The work is carried on under oblong tents, especially on days when the sun would overheat the bars, or possibly heat one end more than another. The starting point each day was a stone pillar having a plug of platina with a silver pin point in it let into its centre. The direction of the line was given by a delicate transit instrument. At the termination of each day's work a heavy triangular plate with a moveable silver pin point in it was sunk under the end of the last bar laid, and the dot in its centre being brought under the focus of the extreme microscope, served as a starting-point the next day. A sentinel was always placed at night over this mark. The extremities of the bases are invariably marked by similar pins of metal let into heavy guns, or blocks of masonry, and protected from injury by some superstructure, as well as by being placed below the surface of the ground.

But we must dismiss bases, and go on with our triangulation, which is the next operation. The first side of our first triangle is, of course, our base. Points on hills or prominent objects are selected, and other points beyond these, generally increasing in distance from each other as they recede from the comparatively small base. At all these stations as well as at the extremities of the base, the angles between all other visible points are observed; the instruments being placed over the stations with every regard to a continuance of the minute accuracy implied in the use of fine dots at our base points.

The sides of the triangles, *i.e.*, the horizontal distances of the stations on the hilly ground from the ends of the base, are calculated with great care, and form fresh bases from which the distances to other stations can be ascertained in like manner.

The method is continued until the territory to be mapped is spread over with a network of triangles, the sides being in proportion to the extent of the survey and the quality and correctness of the instruments employed; care being taken that the sides of the triangles should rapidly increase from the measured base, and that the angles should be about 60°.

This network of triangles was finished in 1858, and encloses, so to speak, the United Kingdom of Great Britain and Ireland; for the angle of one of the triangles is at the St. Agnes Lighthouse, off the Scilly Isles, the angle of another triangle is at Saxaford, the northern extremity of the Hebrides, and a third on the west coast of Kerry.

The great triangulation being effected, the country has to be cut up into smaller portions for the surveyors of the details, *viz.*, roads, rivers, railways, houses, fences, hedgerows, etc.

The largest instrument made use of for observing

angles on the Ordnance Survey is a theodolite three feet in diameter. It has been upwards of seventy years in use, and upon the highest mountains, and at most of the trigonometrical stations in England, Scotland, and Ireland, and was the instrument used in making the necessary trigonometrical observations to determine the longitude between the Observatories of London and Paris. It is on record that a station has been observed with this instrument at a distance of 111 miles, *viz.*, from Sea Fell, in Cumberland, to Slieve Donard, County Down. The distances between Sea Fell and Snowdon, and Snowdon and Slieve Donard, from which observations were also taken, are nearly as great.

Theodolites, eighteen inches diameter, are used for determining the secondary triangles, the length of their sides being about ten or twelve miles. These are subdivided into lesser triangles of sides from one to three miles, the angles being observed by seven-inch theodolites.

The great trigonometrical work may be said to have been conducted and brought to a close under the successive directors of the survey, Generals Roy, Mudge, and Colby, men who had all worked unceasingly in the wild life of their mountain labours—labours of which little has been written, but much might be said—on lone mountain tops in all weathers, and far on into winter when travelling was laborious (for there were no railways in those days and few roads)—often with but poor fare—at times, too, reft by storm of even the shelter of their tents. Let me record an incident in point.

The tents of a surveying party being liable to be blown down the mountain side, the occupants were in the habit of sleeping with their working garments under their pillows. This custom, however, was not approved of by a young Irishman, who lacked the experience of mountain tempests, and in spite of the warning of his comrades, usually suspended his attire from the tent pole. One night, however, a violent gale swept away the encampment to the bottom of the valley, and in consequence Paddy not only presented a deplorable appearance, but became a conspicuous object in the midnight search for the debris of the camp, every new comer illuminating him by turning his lantern upon him, to ascertain whether he really belonged to the camp, and then generally greeting the unhappy surveyor with a loud laugh. History is silent as to the length of time Paddy "stood in the cold."

To observe a distant object it must be visible, and to observe it well, that is often, so as to obtain a mean or average of a number of observations, you may wait weeks, even months. The haze of the atmosphere, even in fine weather, being an enemy to the telescope, the sun's rays in the early days of the survey were, with the assistance of mirrors or tin plates, made available for rendering distant stations visible from each other. As the sun's rays could not, however, be borrowed in sufficient quantity from the moon to be of service at night, Bengal lights, argand lamps, parabolic reflectors, and plano-convex lenses have been used with more or less success to produce lights sufficiently brilliant.

The light invented by Captain Drummond, R.E., in 1826, far surpassed previous contrivances. It consists of a ball of lime, placed in the focus of a parabolic reflector, and raised to an intense heat by a stream of oxygen gas directed through a flame of alcohol. The brightness was so intense, that a station at Slieve Snacht, in Donegal, which it was of great importance to view from Mount Divis, near Belfast, sixty-six miles distant, was, in spite of hazy weather, rendered distinctly visible. The experiment, however, was conducted under con-

siderable difficulties, for the season was inclement, and as Mount Divis and the surveying camp were enveloped in snow, with a keen cold wind continually blowing, the situation was more romantic than agreeable. More than once a storm carried away the few worldly possessions of the party; and the occupants of the camp at Slieve Snacht, at an altitude of 2,000 feet, were not better off, for their tents were so shattered that they had to obtain shelter by building rude stone cabins. At last, however, the light was directed on Mount Divis, and, notwithstanding the keen blasts, it was at once seen by the Sapper sentry there, and burnt for the required time with great brilliancy. Thus years and years were saved in time that otherwise would have been lost waiting for excessively clear weather.

In flat countries or about large towns the trigonometrical stations were necessarily upon buildings, and on curious ones too. On Norwich spire the great theodolite was 299 feet from the ground. Some of the stations above church spires rocked in even gentle breezes in a manner by no means agreeable. But the station which attracted most public attention was that on St. Paul's, London.

A survey of London, with the primary object of improving its sanitary condition, was commenced in 1848, and terminated in 1850. The City was covered with a network of triangles, the summits of Primrose Hill, the tops of towers, steeples, roofs of churches, etc., etc., having been made available as trigonometrical stations. By their aid the relative position of every street, square, and alley, with their relative levels, was gradually ascertained and mapped. The survey extended eight miles from St. Paul's Cathedral, and above its cross was one of the principal stations. The account of the construction of the station or "crow's-nest" round St. Paul's Cross is so interesting that I have extracted it from the "History of the Royal Sappers and Miners," by Quartermaster (now Captain) Connolly, R.E. :—

"The scaffolding was of rough poles. The stage, ten feet square, formed of planks, which supported the observatory, rested on the gallery on the top of the great cone. The four lower posts, twenty-nine feet long, stood upon short planks, bedded on the stone footway, and the top supported the angles of four horizontal planks, each twenty-three feet long, bolted together at the angles. From these planks rose a screen, to prevent materials, etc., from falling. The base of the four upper posts, fifty-three feet long, rested on the angles of the above planks, and the scaffold, in addition to these posts, consisted of four sets of horizontal and four sets of transverse braces on each side, the whole being fastened together with spikes and ropes. Fifty-six of the up-rights were double poles, placed base and point, and bound together with hoop-iron and wedges, and with bolts and hoop-iron at the splices. The height from base to floor was eighty-two feet, and to the extreme top of the observatory, ninety-two feet. A railing surrounded the 'crow's-nest.' The ascent was made by the inside of the tower or lantern to the circular openings, then to the outside of the foot ladders set at the north-east corner, parallel to the north-east principal post inside the scaffold. The whole of the materials were drawn up from the floor by a permanent windlass erected in the tower, to the Golden Gallery, and thence passed to the outside through an aperture thirty-two inches wide, and finally were drawn up and put into position by an apparatus erected for the purpose. The whole construction weighed about five tons, and the time occupied in going up the ladder was only seven minutes, the descent requiring only five. In the hazardous and

intricate operations of building and dismantling the 'crow's-nest' not the slightest accident to human life or limb—not even the breaking of a single pane of glass—occurred."

The history of the scale of the survey maps may be regarded as a history of the advance of wealth in the kingdom. When General Roy commenced England, it was deemed sufficient to engrave the maps upon the scale of one inch on the paper to a mile on the ground. These maps, engraved for all the South of England and Wales, show roads, parks, rivers, and (by shading) the hills and valleys. When the survey in 1824 was to be extended to Ireland, a committee reported that nothing under six inches to a mile would suffice. Upon this scale, which shows every fence, field, and house, maps of Ireland have been published. The North of England perceived the improvement, and for many years after the Irish maps had shown the way, maps of the Northern Counties, and subsequently of part of the South of Scotland, were published on this scale. The value of these maps, and the possibility of making them of still further value if on a larger scale, became so apparent, that after deep consideration by a Parliamentary committee and scientific commissions in 1853, it was resolved to do the cultivated lands on a scale of about twenty-five inches to a mile. Maps of towns and cities according to their size and character have also been published on scales of sixty and 120 inches to the mile. In these every lamp-post and doorstep can be correctly made visible.

Had England and Wales been originally surveyed on the twenty-five inch scale, the country would have been saved the expense of the survey made some years ago (at a cost of about £4,000,000) by the Tithe Commissioners.

Some of the northern counties of England, and many of those towards the south of Scotland, also the isles of Arran, Rothesay, etc., etc., have been surveyed upon this scale. Its value is almost incalculable; and for want of a similar one in the neighbourhood of Portsmouth, Plymouth, Dover, Pembroke, Sheerness, and other localities where certain fortifications (now either in progress or completed) were proposed to be constructed, a special survey of those districts had to be made at some considerable expense.

In the early maps hills were shown by shading, and for small scale maps this method of delineating ground still holds its place and retains its admirers. On six-inch maps shading would be confusing and lack artistic effect. Numbers of actual instrumental levels have therefore been introduced referable to marks on houses, milestones, etc. etc., and to these, contours, or level lines at equally distant *vertical* heights, have been added. These render a map so perfect, that civil engineers have given evidence that they could with a sufficiency of contours, sit at home and trace a railway within any narrow limits of its proper position.

Up to 1842, the datum level for the altitudes of the principal mountains and hills of Ireland was low-water spring tide, but in England the datum was the mean level of ordinary tides. A series of observations having determined that the latter level was the most constant, it has been adopted in the survey of Scotland and the North of England. During its progress, as opportunity offered, the altitudes of the chief mountain ranges and hills were ascertained, by which it appears that Ben Nevis, in Aberdeenshire, is the highest mountain of the United Kingdom, being 4,406 feet above the sea.

Before parting from our subject it is but fair to say that the Ordnance Survey has been one of the best conducted public institutions in the kingdom. To the late

General Colby is this chiefly due. His officers were invariably selected by merit; and if found not equal to expectations, were soon changed for abler. The names of Drummond, Portlock, Sir Thomas Larcom, and Captain Ross Clark, all engineer officers, are household words in the homes of science. Under General Colby the officers were trained to disregard all personal consideration and to give all their attention to the work in hand. The annals of the survey tell how General Colby has walked many miles over mountains before breakfast; and the twenty or thirty mile journeys he made day after day with his subalterns at almost racing pace over the roughest country, evidence how he infused energy by example. Not content with example, he carried with him the highest feelings of his officers by embracing every opportunity to publicly acknowledge any improvements suggested by them, however junior their rank; and perhaps in this was the secret of his success in rearing zealous men. Had he lived until Lieut.-Colonel W. D. Gosset, R.E., initiated the application of photography as an economical method of reducing plans from a large to a smaller scale, and until Captain De Courcy Scott, R.E., by his chemical researches developed this into photozincography, whereby thousands a year have been saved, he would have gloried in making known the authors of the improvement. The solicitude of his officers for their work was as remarkable as it was sincere. Their observing instruments they regarded almost as mothers do their children; and there are yet a few living whose eyes brighten as they talk of "Ramsden's" (the familiar name of the great three feet theodolite), and the old days of the trigonometrical survey. The pastimes of these gentlemen in hazy weather on the mountain tops were not many; but a favourite one with officers and men, was to dig about some huge rock, often several days' work, and at last by powerful levers to detach the mass, and send it hurling down the mountain side, crashing, and dashing, and bounding away, a great Leviathan in its disportings.

As might be supposed, many of General Colby's lieutenants have been called upon to fill important situations in other departments of the State, both at home and in the colonies, and with advantage to the public service.

The head-quarter-office of the Ordnance Survey is at Southampton, to which station it was transferred after the destruction of the Map-office at the Tower by fire; and there are branch offices in London, Edinburgh, Dublin, and at other stations, when required. In addition to the general business, the engraving and printing the maps is carried on at Southampton; also the reduction of maps from a large to a small scale, by the aid of photography. The force consists of four companies of the Royal Engineers and a number of civil assistants, every branch being under the direction and control of the Royal Engineers, who are responsible that the work is carried out accurately, and in accordance with prescribed instructions.

The Ordnance Survey has long been in existence, but it began by a travelling map of England. It is progressing as a work which will subserve every known purpose of valuation, agricultural statistics, and taxation, that can be worked from accurate detail plans. It is to be hoped that it will not conclude until it forms the basis and index for a complete registration of deeds, connected with the sale, lease, mortgage, or demise of property, whereby the transfer of, and all transactions relating to, landed property might be as easily effected as a transfer of stock in the funds.

Although the Ordnance Survey appears to occupy a

long period, it must be remembered that every year the face of the country in many districts undergoes considerable change. Cities and villages spring up; railways, bridges, and roads are constructed with marvellous rapidity; woods are cut down, or arable land converted into plantations; so that new measurements and maps are often required to keep pace with the modern architect and engineer. At the same time every bleak mountain, forest, moor, river, plain, is gradually brought under the power of the Ordnance Survey.

The latest official report of the Director-General of the Ordnance Survey and Topographical Department to 31st of December, 1867, states that in England the survey is proceeding in the counties of Kent, Surrey and Hants; and we are completing the survey of the interior of London. The general progress of the survey has been greatly retarded by the excessive amount of work required to make a perfect survey of London and its environs, but except the central sheets, the plans are now well advanced and many of them published. The parish of Aberdare in South Wales is now being surveyed, and drawn on the scales of 1—500, and 1—2—500, the inhabitants having undertaken to pay £2,200, two-thirds of the actual cost, in consideration of their having the survey of their town made immediately. In Scotland the survey is proceeding in the counties of Aberdeenshire, three-quarters of which is surveyed, Banff, which is nearly finished, Elgin, Inverness, and Argyle. The small county of Nairn has been finished. In Ireland the county of Dublin and the township of Bray in the county of Wicklow, have been revised and redrawn on the scale of 1—25,000, for the purpose of the valuation, as Sir R. Griffith, the chief valuator, did not consider the valuation of so closely inhabited a county could be properly valued with plans on a lesser scale. The survey of the Isle of Man is finished, and the plans are in progress. The cost of this survey will be defrayed out of the revenue of the island.

MY FIRST CURACY.

CHAPTER XII.—VEXATIONS AND DISAPPOINTMENTS

THERE are vexations and disappointments in every class of life. Yet perhaps a clergyman is exposed to a greater number of vexations and "worries" than fall to the lot of others. I am not speaking now of personal and private troubles, but of trials in the work of the ministry. Nor am I speaking morbidly, nor despondingly, though the frightful scenes of disease, distress, and poverty combined are quite sufficient to cause a man to despond. Still it is very hard to see one's hopes blighted and desires frustrated, when all has been done that is in our power for the benefit of some individual in whom a great and warm interest had been taken. Yet a clergyman, knowing that these trials will not fail to come, should be prepared to meet them. He should remember the text, a very favourite one of mine, and one which has often brought light in darkness, "All things work together for good to them that love God."

I will relate a case or two of bitter disappointment.

A young man in whom I wished to take an interest, but to whom I could not readily obtain access, he being rather wild and careless in conduct, was one day thrown from a waggon when half tipsy, and broke his leg in the fall. It was a bad fracture, and he was confined to his bed for six weeks. I cannot say truly that I was altogether sorry for this accident, for I was thereby enabled to get near him, and try what influence I could exercise over him for the future. I went to see him at

once, and attended him nearly daily the whole of the long period he was confined to his bed.

I tried to make his wearisome hours as pleasant as possible; accordingly, I taught him several games, such as chess and draughts, and lent him interesting pictorial books. I did this partly as a help to his recovery, which depended much on his general health, but chiefly in order to gain his ear for his spiritual welfare. Often as I read and prayed with him, the tears would run down his cheeks, and he would promise fervently to lead a holier and more steady life. Now, if he had died during this illness, his friends would have said that his repentance was sincere, and I might have coincided with that judgment. But was it true, real, and genuine?

He rose from his long confinement perfectly cured. He also went to church once after, it is true; but he quickly made vast strides in the downward path, and became much worse in his habits of life. He behaved so badly that he ran away to the city of Exeter, leaving a poor village girl to die of a broken heart, her last words breathing a prayer for him. Oh, how bitter was this particular disappointment to me! But does it not show the hollowness of so many apparently genuine repentances, and the caution required in judging of them?

After I had been in my first curacy a few months, I became painfully aware that my visits to a sick man, instead of doing good, produced positive harm. In this instance I had been asked one day to visit a man in consumption. I was warned that I might not find him very civil, as he was of a morose, sullen disposition, but nevertheless it was thought he would receive me. Accordingly I went, and in answer to my knock the door of the house was opened by a tall, military-looking man, standing about six feet three inches at least; he begged me to enter, and, strange to say, was extremely civil and polite.

In order to open conversation with him, for I had not previously seen him, I asked if he had always lived in Devon, to which question he replied that he had been a soldier in the Horse Guards, and since the period of his discharge had travelled in America, of which country and its institutions he seemed very proud, and concerning which he told me many interesting anecdotes. He made also shrewd remarks touching the state of England, and its government, which caused me to notice his finely shaped forehead. Altogether he was a remarkable man both in body and mind. After a little more general conversation, I relieved his bodily wants, and took my leave, intimating that I should call again, to which remark he made no objection. During my next visit I found the thin edge of his moroseness inserted: he was not quite so polite, still I thought people had much exaggerated the evil of his character. He spoke disdainfully of the higher order, and yet the tone of his voice had a certain tinge of envy in it, as he decried their wealth and power. I found also he had some queer notions respecting the laws of this country, and he so excited himself while talking, that it produced a violent fit of coughing which quite exhausted him. When it subsided I left, feeling saddened at my want of success, for hitherto religion had hardly been named between us, as I had been especially warned not to speak upon it until I had made some way with him in common conversation. I made two more attempts to bring him to a right understanding of many things, for it seemed his judgment was perfectly warped, and he was besides exceedingly bigoted. During these later conversations, I found that he was a complete infidel.

A few days after my last visit, his wife called and wished to see me. The object of her call was to ask me

to discontinue my visits to her husband, and she was prepared with reasons to back her request. She told me, in vindication of her conduct, that her husband, not being able for some reason or other to fall out with myself, he after each of my visits had given her a severe thrashing, for allowing me to come in and see him, though it was himself in the first instance that opened the door, and so gave me entrance. Three successive beatings the wife had borne in silence, being anxious for his soul's sake that I should speak to him upon the subject of his approaching death; for the surgeon had told her most distinctly, from the nature of his complaint, that he would never recover. But the fourth beating she received was so severe that she said she could not endure another such, even for the sake of my visits. I now know that these acts of cruelty were of frequent occurrence, and were not invariably caused by the advent of "the parson." The wife added that as lately as that very morning, because the new loaf of bread which she had provided for his breakfast was not exactly to his liking (I think she said it was not crusty enough), he cut it into small pieces, put the fragments into a wooden bucket, piled up all the fuel in the house upon it, and covered it with burning peat, daring her to touch it till all was consumed. Nor was this a solitary instance of outrageous conduct. Yet he was entirely dependent upon his wife for everything he had, not having been able to do a stroke of work for eighteen months.

Now I have only singled out two particular cases of disappointment from a vast number, and the sole reason why I do not give the details of other more depressing disappointments, is because they are more personal; they consist of ingratitude of the deepest dye, practised towards myself.

I may, however, bear my strong testimony as to some causes and some times of special annoyance and sorrow. How I dreaded the season of Whitsuntide! There was a kind of fair held in one of the hamlets of the parish at that period, ever since old times. Why it was held in that spot I never was able to ascertain; but its effects upon the young people were most baneful. More girls were at that season led astray than in all the remaining portion of the year put together.

"Mops," or statute-hiring, also occurred once a year in our neighbourhood. They were held on the borders, and not strictly speaking within the bounds, of the parish. I attended one of these mops, and I can assure my readers who have never seen one, that it was a most disgraceful scene. The waggoners had whipcord and ribbons round their hats; the servants wanting cooks' places held little gridirons in their hands; housemaids brushes and dustpans; dairymaids milk-cans; ploughmen and labourers toy implements representing the situations they respectively required: so that without any questions you saw at once what place the person waiting to be hired wanted. No character was asked for or given. The hiring was merely for a year. The second or third day (for these mops were held for several days, the publicans reaping a rich harvest each evening), wages fell, just as prices do the last few hours of an ordinary cattle market, the best beasts having previously been disposed of at a higher rate.

Happily the efforts of philanthropists have been and still are directed towards the suppression of these disgraceful scenes, and with great success, I am glad to add. The evils attending this pernicious system, both with regard to master and man, maid and mistress, are too apparent to need comment.

That particular part of Devonshire in which my first curacy was situated, was nearly entirely given up to

"the gang system," one of the greatest curses, I believe, to the well-being of the morals of the labourers' children. It is also the constant bugbear of the parochial clergyman. For instance, no sooner is one school nicely established and the attendance good, than one fine morning you enter the room and find it nearly deserted, and the schoolmaster or mistress in great trouble; for all education is virtually abandoned at such times, when "stone picking," "bird keeping," "potato gathering," "bog or peat turning," arrives. Thus the children's education proceeded under great difficulties, which made the establishment of night schools and adult classes all the more necessary.

BUSINESS HOURS IN LONDON STREETS.

THE lower we descend in the scale of commerce and traffic, the harder and more oppressive becomes the labour of those by whom business is carried on. When the great Baron Rothschild used to take his station at that pillar in the Royal Exchange, and transact his momentous bargains more by nods and signs than by articulate speech, he was seldom there for more than an hour or an hour and a half in the day; yet in that brief space of time it was nothing unusual for him to gain from fifty to a hundred thousand pounds. Our merchant princes spend but little time, comparatively, in their offices and warehouses, and derive their magnificent incomes without undergoing anything like bodily labour, being able to delegate all that to others. It is much the same with the prosperous banker: his hours are fixed, to be sure, but they are few and limited, and followed by certainly-recurring leisure. So with the wealthier class of dealers and traders in the money-making callings; they can and do shut up their shops and places of business early in the evening, and betake themselves to the enjoyments they most affect. It is different with the average trader, who pleads that he must make the most of his day in order to keep his credit good; and it is still more different with the struggling one, who must rise early and go to bed late, and eat the bread of carefulness, that he may make both ends meet, and have bread to eat at all.

It is in the traffic of the streets that the limitations as to time are the widest, and the struggle for bread is the fiercest. There are peripatetic traders of one class or other pursuing their occupation in the highways and byways of London for more than twenty hours out of the twenty-four; they are the earliest and the latest of all the traffickers of the metropolis: so early and so late, indeed, are some of them, that to many people it is a mystery what business they find to do. Let us glance at one or two of them.

The early breakfast-houses in London, thousands in number, though they open long before sunrise, are anticipated in their labours by the early breakfast-stalls erected in the streets. We have come upon these stalls at their first appearance less than three hours after midnight. They are among the oldest of the street institutions in London, and are doubtless a boon to a large class of early workers, who, rising long before dawn, are enabled by their means to break their fast with something solid and something hot at the price of a penny or threehalfpence; and they are no less welcome to the poor night-wanderer, who, not having twopence to pay for a bed, camps out, and hoards his one penny to pay for a breakfast. The breakfast used to consist of a thick hunch of bread, with dripping or salt butter, and a cup of saloop, which was a decoction of sassafras

chips, in place of salep (the dried and pounded tuber of *orchis mascula*), sweetened with coarse sugar. Since the fall in the price of tea, saloop is gone much out of fashion, though there are still a few of the old staggers who supply it to customers to whom use has made it pleasant. The salopians pitch their stalls in all weathers at all seasons of the year, and for the most part in spots where in daytime the traffic is densest: we have seen them in the Strand, in Holborn, on the bridges, and in the most frequented parts of the City. They vanish before the business hours, and that of necessity, for the crowd would crush them out of the way did they attempt to remain. An exception seems to be made in their favour in Covent Garden, where they do business under the piazzas to a later hour.

The milkman is known for an early bird, but he is not generally known for such an early bird as he really is. He has to turn out often before four in the morning, to get his horse in the cart and load his empty cans, that he may drive off to the railway-station and exchange them for full ones—most of the London milk now coming daily from the country, and being sent up by the earliest trains. Almost as early, the watercress hawkers betake themselves to Farringdon Market to buy their stock, and to cleanse and bundle it in preparation for hawking. About the same time the straggling hosts of costermongers begin to invade Covent Garden and Billingsgate. Few people who have not witnessed their matutinal gatherings have any conception of the numbers of these gentry. They not only inundate the district, but literally overflow in all directions, blocking up the channels of approach from every quarter, and presenting in their motley assemblage a spectacle as startling as it is significant.

Of the mass of traders of all descriptions who throng the thoroughfares during the ordinary business hours, we can say but little here. Their numbers, which have always been great, are constantly on the increase. With the growth of wealth around us there is, and always must be, a corresponding growth of poverty—and numbers are being constantly thrust into the streets to earn a living, who in times past were able to maintain themselves at home. This is one reason—perhaps the principal reason—why within the memory of the existing generation the traffic of the streets has assumed so many and such various phases. Time was when little if anything besides comestibles was sold in the street. Pies, gingerbread, cakes, nuts, fruits of all kinds when they were in season, fish just arrived from the sea, vegetables for the table—such used to be the stock of the street trader, supplemented in summer by flowers "all a-growing and a-blowing" in pots, and flowers in bouquets and posies gathered from the garden. We have changed all that now, and indeed have been long familiar with the change. At the present moment you can buy almost anything in the streets of London without troubling the shopkeeper—anything, that is, which is at all portable. The travelling stationer hawks his writing paper and envelopes; the printseller sets out a gallery of art in the concavity of an upturned umbrella; the cabinet-maker decks the dead-walls with his writing-desks, work-boxes, and letter-racks; the cutler sidles up to you with his razors; the working optician claims attention to his eye-glasses and spectacles; the toy-maker displays his stock of toys on the kerb; walking-sticks, padlocks, dog-collars, carpenters' tools, microscopes, mirrors, musical instruments, flat-irons, roasting-jacks, pots, pans, brushes, mops, glass, china, tin-ware, jewellery, statuary, paintings in oil—all these things, and a thousand things besides, walk the streets

of London on the backs of their producers and purveyors, all eagerly on the look-out for a market. The number of wandering commercials engaged in this multifarious traffic has never been even approximately ascertained, and probably is not ascertainable; they must amount to some tens of thousands, and seeing that the rents of shops are constantly growing dearer, while the flag-stones are free from both rent and taxes, there is little likelihood at present of their diminishing. We leave this heterogeneous cosmos of commerce to the reader's tender mercies, confessing, however, to a substratum of regard for them all, and commending them to his kindly consideration.

But now evening draws on, and the nomads whose business has special reference to the decline of day begin to make their appearance. Hark! that is the muffin-bell, followed by the voice of the muffin-man! Of all the "wandering voices" that charmed the ear of the poet, commend us to him. No *vox et preterea nihil* is his, but *vox* and muffins to boot, with other succulent dainties which muffins bring in their train. Listen to what he says—

"Come buy my nice muffins, and crumpets, and pikelets,
Come buy them of me!
You'll find them hot, and large, and good,
And they're all fresh baked for tea!"

He composed that beautiful lyric himself, without assistance from the poet-laureate or any one else; and if you feel disposed to criticise the muffin-man's muse, recollect, if you please, that whatever you may think of his metre, his muffins are irreproachable, and be sparing of your strictures. For our part, we never find fault with the "good man's poetry," as he calls it, choosing rather to confine our remarks to the burden of the song—the muffins themselves. Still there is one thing mysterious about the muffin-man, which has perplexed us any time these forty years, and which we could never satisfactorily get over—and it is this: why muffin-man? or muffin-boy, which is the same thing in the future tense? What have the women and the girls done, that they are rigidly shut out from the commerce in muffins? Who ever heard of a muffin-woman, or a muffin-girl? And if not, why not? as argumentative people put it. Is there any salique law that forbids the succession of the softer sex to the sovereignty of the muffin-basket? If so, give us the authority for it and set our minds at rest. For more years than make up an average generation have we looked for the muffin-woman, and have never found her, or even a trace of her. Nay, more; amid all the stir that has been made of late for woman's rights—notwithstanding all the women's conventions that have been held—the muffins have been kept carefully in the background, and usurping man (and boy) left in undisputed possession.

It is summer-time, and the sun is setting, his level beams piercing the hazy atmosphere and garbing the London chimney-pots in red shirts, till they look like an irregular squad of Garibaldians. About this time there is a branch of street trade carried on for an hour or two which always has a claim on our sympathies. Of the growing flowers in pots which left Covent Garden in the morning, many yet remain unsold. They have drooped and languished under the fierce mid-day sun, and their owners have been obliged to carry them to some sheltering shade, and quench their raging thirst, in order to restore their failing blossoms; and now they have revived again, they are brought forth in the cool of the evening to be sold for what they will fetch. Buy a few of them, my friend, for your bow-window or parlour flower-stand, and don't allow your knowledge of

the fact that their owners have no place wherein to stow them safely for the night lead you to drive too hard a bargain.

About the same time you may chance to fall in with the country lad who brings to London a dripping hamper of water-lilies in the bud. He never gathers them in flower, as, once blown, they will not long survive away from their native pools; but he plucks them by hundreds in the bud, and pulls them into full bloom as fast as they are wanted—converting the shiny, unsightly cone, into a glorious vision of beauty by a few touches of his fingers—or he will sell you a couple of the buds for a penny and leave you to open them yourself if you prefer it. You don't catch him in the full glare of sunshine, but either in some shady shelter or in the cool of the twilight hour.

At certain recurring seasons old ocean sends up her supplies of food to our shores, of the arrival of which the Londoner gets his first information from the cries that resound through the streets after dark. At one time it is sprats that are hoarsely vocal in the thoroughfare as the hour of supper draws near. It is a current notion that everybody sups off sprats once a year, though they might do worse; what may be nearer the truth is, that everybody has the opportunity of doing so when the sprat season comes round. At another time it is mackerel, and it is noteworthy that these fish are allowed to over-ride the fourth commandment, and the statute of Charles II enforcing its observance, and to be hawked and bawled for sale on the Sunday—a privilege, if it be a privilege, which our customs accord to no other fish that swims. Crabs and lobsters are often roving about the suburbs up to ten and eleven o'clock, but they only indulge in these rakish habits in hot weather; the truth being that they are in a hurry to be eaten while they are worth eating, which they assuredly will not be if they are relegated to the chances of the morrow.

One might suppose that when all the world had had their suppers, and the major half had gone to bed, there would at least be a cessation of the trade of hawking eatables in the street. By no means. It is not at all unusual for us to be roused out of our first sleep by a cry which may reach us while it is yet a quarter of a mile off, and is shot explosively from lungs of prodigious power, to the tune of "Hot! all hot! smoking hot!" As late as half an hour after midnight have we heard this cry in the far suburbs; it proceeds from the vendor of baked potatoes, who, carrying his wares on his head, and travelling at the quick march, literally hunts down his belated customers, sending forth his stentorian cry to herald his coming. Who and what are the unenviable class dependent upon him for a meal, we must leave to the conjectures of the reader.

Thus it is seen that the latest supper-time of the street nomad and his earliest breakfast-time are but a brief space apart: a little more, and we should have brought the serpent's tail round into his mouth, and made of the street traffic one complete circle. It is not so, however, we are thankful to say; there are two or three of the small hours still left in the morning when the busy spirit of traffic is lulled to quietness, and the echoes have rest in the interminable thoroughfares. We should like to extend the narrow margin of silence, and stretch it over a few more of the hours of darkness; and we cannot help longing at times, amidst the boastings of onward progress, for so much retrogression at least as shall give back to our homes the silence of the night, and to the labourer the hours of sleep for his needful refreshment and repose.

THE LEISURE HOUR

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Courper.*

GETTING READY FOR A SWIFT DESCENT.

THE EXILES OF SALZBURG.

CHAPTER I.

LIGHTLY and mildly the south wind traversed the Alpine tracts of the Tannen Mountain, in the archbishopric of Salzburg. On a thousand flowerets the glistening tears of the morning dews sparkled like diamonds in the rays of a May-day sun. On the green velvet of the young grass the solemn chief of the lowing herd marched along with the far-sounding bell pendant from his ample and powerful neck, attended by the dun cow, the bearded goat, and his bleating flock. From the dark

blue vales arose small clouds of white vapour, which, dissolving into long semi-transparent lines, resembled veils floating above the wood-darkened ridges of the mountains. Gigantic eminences reared their hoary summits unto the azure sky.

A man, in years already beyond the middle age, still active, and whose appearance bespoke him of a respectable class, was with difficulty ascending the steep.

"Oh!" exclaimed he, almost breathless with exertion, as he loosened a burden from his back and stretched himself out upon the grass. "Oh! this is indeed a mountain to climb! These stiff ascents soon make the

infirmities of the body apparent. My feet totter, my chest aches, and my arms are weary and benumbed. Once this toil was almost a pastime!" and after a little pause, he thus soliloquised, with his eyes raised towards the mountains still above him: "Yes, yes, noble Watzmann there! and thou, stupendous Gœhl! with snow-capped summits pointing to heaven, you remind me that above is our only true fatherland; for there, no Archbishop von Firmian domineereth, to pursue us, with his familiars, like hunted deer."

The wanderer now gazed fearfully around. "Hist! silence, old man! for though none but quadruped observers are moving about thee, a Jesuit may probably lie in wait concealed among them, in order to detect the execrated heretic. But, at all events," said he, with more of serenity expressed in his countenance, "the very creatures of the fields around me are not without their protector."

Rising up, and after a long and careful survey on all sides, he raised his voice aloud: "Ho! hallo!" cried he, "is there no one here who can assist a weary traveller to a refreshing draught? I thought so!" he murmured, as a form arose from behind one of the huge fragments of rock which were lying strewn around. "So I thought! Be wary, George," he said to himself, in an undertone, "though that fellow does not look like a spy of the priests either." He now drew near to the shepherd, who was a stout, ruddy youth.

"Praised be Jesus Christ!" was the traveller's salutation.

The face of the shepherd, which at first had assumed a friendly aspect, darkly lowered, as he curtly responded, "Good morning."

Although the reply seemed cool, the stranger's countenance brightened up. But feigning a reproachful look and stern tone of voice, he continued: "How! art thou not a good Catholic Christian, that thou knowest not how to make a proper answer to my greeting? And what do I perceive? Thou hearest neither rosary nor scapulary, as the lordly fathers have expressly commanded."

"I am truly a Catholic Christian," gruffly answered the shepherd; "and if I am not quite a good one—for none is good but God alone—I believe myself to be better than thou art, since thou usest the name of our Saviour without necessity, and therefore without reverence."

"That does not proceed from thine own brain," observed the old man, with satisfaction. "I should like to know the source of this wisdom. Be not hasty, young man," he continued, laying his hand in a pacifying manner upon the shoulder of the shepherd, who had now become heated with zeal. "I agree with thee, but thou canst not blame me for having tried thee a little in the first instance. No doubt thou art aware how the worshippers of our Lord, in spirit and in truth, are persecuted in the valleys below, by those who name themselves, indeed, after Jesus, but who are ravenous wolves in sheep's clothing. But I am thirsty. Hast thou no fresh milk in store?"

Both the men now stepped up to the rock behind which the shepherd had been reposing, and the latter, producing a large pitcher, cordially offered its contents to the stranger, who, although thirsty as he had previously declared himself to be, instead of accepting it, took hold of the youth's hand, which he observed clasped an object that intensely excited the traveller's curiosity.

"What!" he exclaimed. "Dost thou use a book for a cover to thy milk-jug? Let me see it."

After some hesitation the shepherd presented it to him.

"Dr. Arndt's 'True Garden of Paradise,'" said he, reading half audibly, and marvelling greatly within himself. "How camest thou by this book?" he asked.

"I bought it," answered the shepherd, with a joyful air of satisfaction.

"For the cover of thy milk-can?"

"By no means," said the other, testily. "I was deeply considering it when thy call disturbed me, and I always read it when I can find time."

"Then thou knowest how to read?" asked the traveller, doubtfully.

It was not without a modest blush, nor yet without evident satisfaction, that the interrogation was answered, "Yes, a little; I take pains."

"Rightly dost thou, good youth. Thou hast learned the one thing needful; I see it in the choice of thy book. Like Mary, thou hast chosen the good part. But dost thou also possess the treasure out of which the pious Arndt constructed his 'Garden of Paradise'? Hast thou a Bible?"

The young shepherd shook his head, and at this moment hastily seized his book, exclaiming, "Here comes the warden of Werffen,* who might have caught me with this volume."

"Who? what? the warden of Werffen, didst thou say?" inquired the stranger, pale and terrified.

"Yes," replied the shepherd. "There he is approaching with his followers."

"Thinkest thou he will come hither?" asked the other, trembling.

"Assuredly; the footpath leads directly to us, and over the part which thou hast ascended."

With the utmost fear expressed in his features, the stranger ran back for his bundle, and placing it upon his shoulders, asked the shepherd to show him a place of concealment.

"If thou hast cause to be afraid of the warden," said the shepherd, "thou art in danger, for, even if by any means thou couldst elude his eagle-eye, and hide thyself behind one of these jutting rocks, his mastiffs would certainly scent thee out, or overtake thee, shouldst thou attempt to escape by flight."

"Then," cried the traveller, in a tone of lamentation, "I am lost indeed!"

"Art thou an assassin, that thou art in such distress?" inquired the shepherd, with an air of suspicion and anxiety.

"Were that the case, I should suffer justly, but I am a most innocent man: I am George Frommer, and reside at Nuremberg, where not even a child can speak ill of me."

"Then why dost thou tremble at meeting the warden?" said the shepherd.

"What had Hans Lerchner of Radstadt, or Veit Bremen of Schwabock done," inquired Frommer, "that they should have been imprisoned, and tortured by hunger and thirst, frost and stripes? Only because a Christian book was found in their possession. And what will be my fate, who have here a package full of Bibles, which I am endeavouring to distribute among the poor, forsaken flock of Jesus? Assist me, my son; help a poor old man who has not yet courage to quit

* *Warden of Werffen*.—The principality and archbishopric, now the circle of Salzburg, was divided into four jurisdictions, denominated *Pfleggerichte*, memorials of the practice noticed by Tacitus among the German tribes, whose cantons were under the government of a nobleman deputed by the prince to administer justice, settle controversies, etc., like the sheriffs of the Anglo-Saxons in their respective shires.

this world, to which he is bound by the ties of wife and children."

"Thou art right," said the youth, "thou mightst fare badly if thou wert in the warden's power. There is one means of escaping from him, however, but it does not suit a man who, coming from the plains, is unaccustomed to our mountain toil."

"Ah! I have lived on the mountains longer than thou hast, and it is but a few years since I quitted Salzburg for Nuremberg."

"The better for thee," replied the shepherd, "but thou saidst that thy package was filled with Bibles. I should be rejoiced to possess one of them. What may be the—"

"Stop!" exclaimed the old man. "When death is following close at my heels, can I occupy myself with the affairs of trade? Thou shalt assuredly have a Bible, but I cannot take it out of the package at present. Assist me to depart in safety."

"Take courage," said the youth, "for see they are still passing along the marsh which separates us from them, and in the meantime we can come to a settlement in a few words. Art thou acquainted with the wealthy Mr. Manlicken, at the Shippen?"

"Yes, yes, but the warden!"

"He is not come yet. This rich Mr. Manlicken," continued he, "is my master. I let him keep my wages for me, and he can pay thee out of them, if thou wilt entrust him with a Bible on my account. He will not betray thee," he added, observing the anxiety of the traveller visibly increasing whilst they conversed.

"Detain me no longer," entreated the latter earnestly, overcome by his fears. "Help me! save me!"

"Well, then," rejoined the other, "dost thou not see that I am already making preparations?" Thus saying, he laid hold of a little sledge, which he carried to one side of the Alp, where, covered with soft grass, it sloped almost perpendicularly into the abyss beneath. George Frommer followed.

"Look!" said the youth, "the warden and his followers have not yet passed through the marsh down there, and cannot perceive the manner of thy escape. But prepare quickly: 'twere better that the package should be fastened behind, so as to be drawn after the sledge; it will serve for a counterpoise, and prevent thee from being overturned. So; art thou ready? Here are the shaft-sticks; keep thyself steady whilst I start the sledge in its course; and steer steadily to the left, or thou mayst perchance fall into the marble quarries."

"But what will become of thee, my brave youth," inquired Frommer, who was already slowly gliding over the slippery turf in the little sledge which had been set in motion by the powerful hand of the young man, "if the warden should discover thee?"

"Be not anxious on my account," said the other, laughing. "My 'Garden of Paradise'* is not a piece of bacon or a sausage that the dogs can scent it out, and therefore I am in no danger from him."

"Thanks for thy kindness," said Frommer; and as he cast a glance at the package which was now being tossed from side to side, he exclaimed, "God forgive me! that I should suffer his Holy Word to be thus irreverently treated, but—"

* "*My Garden of Paradise*," etc.—The books to which the Protestants were most attached, and for the possession of which they were punished with pecuniary penalties, were the German Bible, "The Postills of Luther," "Spangeberg," and "Simon Paul;" Arndt's "True Christianity" and "Little Garden of Paradise;" Luther's Catechism, and the Tracts of Schaitberg.—*Schithorn, Comments de Religionis Ecang. in Prov. Salziurg ortu et fatie*, sect. lx., p. 96.

The peasant now removed his hands from George Frommer's shoulders, when the latter shot down in the sledge with a fearful and continually increasing velocity; so that the remainder of his speech was quickly lost. The shepherd looked cheerfully after him as he continued his dangerous descent, and as soon as he perceived that Frommer was almost out of sight, as if suddenly recollecting himself, he called out to the full extent of his powerful voice, "My name is Johannes Weinleidtnr, dost thou hear?" "Dost thou hear!" echoed back the mountain on the right. "Dost thou hear!" was the faint response from the vale beneath.

CHAPTER II.

THE valley of the Werffen lay between mountains whose snow-covered summits now gleamed, in the reflection of the evening sun, with the glorious radiance of gold. The Salza, loudly murmuring, rushed over the rocky ground, scattering a silver foam upon its dark-green mossy banks. The village cottages, standing far apart, were overshadowed by tall walnut-trees, and encircled by thickly clustered vines. Of all these homesteads the most considerable was that called the Shippen. The gentle declivity of the mountain against which it stood formed several terraces, bordered with vines and gooseberry bushes. In the intervening spaces, fine linen was spread upon the turf to bleach, affording satisfactory evidence of its owner's opulence. Outhouses and sheds of smaller size surrounded the spacious court, where the poultry had just finished their evening meal and were repairing to their roost. A number of horses laden with heavy sacks of flour were waiting to be relieved from their burdens. Close by them a flock of sheep pressed with clamorous bleating to consume the savoury repast prepared for them in their pens. The luxuriant fruit-trees which on all sides adorned the court appeared one sheet of bloom, and the aromatic scent of elders, honeysuckles, and woodbines was diffused around.

The owner of this domain was sheltered in an arbour from which he commanded a full view of the road. His cheerful and vigilant partner, his blooming daughter—a damsel just entering into womanhood—and two sons, her juniors, were seated at their frugal repast. Herdsmen, plodding homewards, saluted him kindly as they passed, bright-eyed maidens cast respectful glances, whilst the aged of the village paused on their way to address familiar greetings to the friend and kinsman of all.

George Frommer of Nuremberg approached the arbour in order to execute his commission. With the exception of several rude shocks, his sliding expedition at the morning's dawn had terminated safely. In a few minutes he had made his descent into the valley, which otherwise would have occupied him a couple of hours. It seemed, too, that he had found plenty of customers for his prohibited wares, since he now appeared without his package, and wore an air of contentment.

"May God grant thee a good evening, Manlicken!" cried he.

"The same to thee, George Frommer: whence comest thou?"

"From Nuremberg," said Frommer. "I can never remain long away from my native place, its attractions are always irresistible."

"Then why dost thou not stay here altogether?" replied Manlicken.

"That would not suit me; I have not only my employment, but my wife and children in Nuremberg."

"Thou art of a restless disposition," rejoined his friend, "or thou wouldst change this mode of life."

"Leave me to my own choice, friend Manlicken," said Frommer. "But thou must know that I have already derived a benefit from thee! There is a worthy young fellow keeping thy cattle on the Alp, who willingly gave the traveller a draught of good milk."

"Ah, thou art speaking of our Hans."

"Yes, yes, that is his name. He shouted it after me when I had almost lost both sight and hearing by the rapidity of my journey; Hans Wein something."

"It was Weinleidtner," observed the daughter, eagerly.

"Very likely," said Frommer. "He is a very fine, and, what is more, a very worthy youth, who does not pass his time unprofitably on the Alp, but devotes it to the study of pious books. Moreover, he has preserved me from the warden of Werffen, who, thou mayst be certain, would not have been at all lenient towards me, if my package had fallen under his scrutiny. For this reason I have brought him a great treasure," pointing to a small parcel under his arm; "a Bible," he whispered, cautiously, "for which thou wert to pay me out of his wages; but God forbid that I should take a farthing from him. The holy book is a faithful mirror, in which man need only look, in order to learn how to act through life—a counsellor in joy and grief—a comforter in adversity, and a guide to heaven."

"Peace, softly!" said Manlicken, evincing a little confusion; "think of the warden."

"Of that miserable being, whom I well knew as clerk to the old tax-gatherer?" rejoined Frommer.

"Very true," said Manlicken, "but he is now become our governor, and is a baron besides."

"Humph!" continued Frommer, "through the money of the peasants, which, whether they liked it or not, they were obliged to advance him for the purchase of his nobility. Ah! Manlicken, thy coughing and hemming betray perplexity: ha, ha, ha! he has also laid thee under contribution, I expect, has he not? Well, do not be angry; but—"

"Hush!" cried Manlicken, "help thyself to our fare."

"Thanks, thanks," said Frommer, "but I must be gone, for Anthony Wallner is to expound the word of the Lord this evening to a congregation of our devout countrymen. Thou mayst accompany me if thou choosest."

"I have to remove my flour into the store-room, and to trim the hedge that is running wild behind the court," replied Manlicken, by way of excuse.

"I see," said Frommer, "thou art one of those who, according to scripture, have bought a field, or five yoke of oxen, or taken a wife, and therefore cannot come. Thou art plainly represented in the divine mirror. One thing, however, I say to thee, Lay not up for thyself treasure, which the moth and the rust corrupt, and which thieves dig up; but rather lay up for thyself treasure in heaven. May the Lord open thine eyes! Thou art, surely, not afraid of receiving thy good Hans's property and delivering it to him?" It was not without a feeling of shame that Manlicken took the present, and the worthy distributor of Bibles departed, murmuring audibly, "May God protect thee!"

Manlicken left the task of removing the flour to his wife and daughter, the hedge was suffered to continue in its wild and neglected state, whilst he himself withdrew to his chamber, deeply absorbed in the thoughts of what he had just heard. There he unclosed the sacred volume, turning over the pages of the New Testament. His mind as well as his eyes were riveted

by the passage, "Verily I say unto you, It is easier for a camel to go through the eye of a needle, than for a rich man to enter into the kingdom of God." In great alarm he laid down the book, and for some time continued pacing up and down the room.

At length he called to his daughter. "Barbara," he said, "get a quartern of our finest white flour, a side of bacon, and three score of eggs; take them to the holy father, and desire him to include us in his prayers, that when our time arrives our death may be happy."

With a mind more tranquillised he then returned to the volume, to which he was drawn by an irresistible attraction. He turned over the leaves for a long time to find whether there were other passages which in like manner might be applied to himself. At last he read: "The ground of a certain rich man brought forth plentifully," etc., Luke xii. 16. "But God said unto him, Thou fool, this night thy soul shall be required of thee: then whose shall those things be which thou hast provided?" This affected him deeply. With a secret shudder he caught up the little looking-glass to see whether there appeared any shadowing of that relentless death who he feared might summon him so speedily away. His countenance seemed paler than usual. In order to appease his disquietude he occupied himself with different matters in the courtyard, where, after a little time, he was soon accosted by his daughter on her return home.

"Well, what said the holy father?" eagerly inquired Manlicken.

"He wished to know," replied Barbara, evidently disgusted at the result of her mission, "whether that was our finest flour, if we had only bacon instead of ham, and whether our hens laid only such small eggs."

"Ah! covetous, insatiate priest!" muttered the angry farmer. "But will he include us in his prayer?" he asked aloud.

"Yes, my father, he will include thee; but as for me," said the maiden, colouring with indignation, "he began to address such language to me that I hastily escaped from him."

Irritated and inwardly shocked by the answer he received, Manlicken returned to his chamber, where he gave the Bible in charge to his wife, with directions to conceal it amongst Weinleidtner's effects. All the rest of the evening he spent in company with his sons indoors. At length he sent the eldest in search of his mother, when the latter came back with the news that he had found her and Barbara sitting upon Weinleidtner's trunk, and reading out of the new, thick book. Manlicken felt uneasy in his mind. The cricket, which he heard unweariedly chirping at the foot of his bed throughout the sleepless night, appeared to him the death-watch ticking in ominous warning. He was but little refreshed by that night's repose.*

CHARACTERISTIC LETTERS.

COMMUNICATED BY THE AUTHOR OF "MEN I HAVE KNOWN."

MARY RUSSELL MITFORD.

How different the mental from the physical portrait! The first, a likeness of graceful form and simple beauty; the last, a picture of what Byron rudely called, "a dumpy woman." In person Miss Mitford was short, rotund, and unshapely; but in her manners, easy,

* The historical tale of "The Exiles of Salzburg," by Gustaf Nieritz, is translated for the "Leisure Hour," by the author's special permission, by Mrs. L. H. Kerr, translator of Professor von Ranke's "Servia."

amiable, and interesting, and in her writings, natural, intellectual, and delightful. Her volumes descriptive of country life are charming, and, soon after the first was published, were accepted with deserved admiration by the public. The most famous artists of the Low Countries never produced paintings of greater truth, whether given to character or to scenery; and with her all the same skill was chastened by female delicacy and refined feeling. From manly cricket to childish pastimes, she could follow every turn of the games; and good humour, as well as good sense, attended her everywhere, and guided the spirit of observation upon homely English life.

But she entertained yet higher aspirations in literature, and several tragedies bear witness to her dramatic powers. "Julian and Foscari," and "Rienzi," the best of all, afford ample proof of her great talent and extraordinary perseverance. "Rienzi" was a triumph, and I had next morning a letter from her father announcing the success. Dr. Mitford was a fine, hearty, jolly Whig of the old school, and a magistrate in the county. In person he was the beau-ideal of our pictorial John Bull—bluff, yet gentlemanly, tall, stout, portly, and fresh-looking; and one who, if his physical lineaments were not inherited, certainly transmitted the high good-humour I have noticed to his accomplished daughter. And she had sometimes much need of it; for circumstances demanded that possession of equanimity and contentment which strikingly marked her character, disarming adversity, and creating the sincere esteem and affection of all the friends who knew her.

Yet amiable and gentle as she was, it cannot be supposed that she was deficient in energy or destitute of enthusiasm. If she had been, she never could have gone through the trials of her literary and dramatic labours, and the cares and disappointments which invariably appertain to such a career, and which are but poorly recompensed in the end, even when it is successful.

In her retired rustic home at Three Mile Cross, three miles from Reading, Miss Mitford resided thirty years, cultivating her flowers, mostly of common sorts, and enjoying the shade of at least one fine umbrageous tree, which shielded the poetic spot from the scorching summer sun. Hither her fame attracted many admiring pilgrims and the visits of attached friends. Among the latter I may mention two, who prominently took deep and constant interest in her welfare—the Rev. Mr. Harness, her literary executor, and Mr. Francis Bennoch, a city merchant, whose attentions to her, whether of a literary or comforting description, were incessant, and continued to the last.*

And, as I am naming names, it may not be out of place to commence my illustrations by a portion of a letter, exhibiting the Lyric among her literary pursuits, from the authoress to her last-mentioned friend:—

MY DEAR FRIEND,—That song is now charming, though whether the conclusion will go well to music is more than I can tell. You know, of course, that all musicians, whether composers or singers, complain of Sir Walter, and that even the matchless "County Guy" won't song. If this be so, the

fault will be with me, or rather with my first stanza, for I always feel a conviction that your writings are music in themselves; or rather the fault will be in the additional line, exquisite as to sense, and essential to the accordance of the two stanzas; and after all, a musician of any skill ought to manage it.

The following is the song about the euphony and correctness of which she was so anxious. The second stanza certainly maintains the original sentiment, and the pathos of the whole is as certainly enhanced by the addition of the final lines, which do credit to the co-operation she solicited from her friend.

GOOD MORROW.

Good morrow, good morrow! Warm, rosy, and bright
Grow the clouds in the east, laughing heralds of light;
Whilst still as the glorious colours decay,
Full gushes of music seem tracking their way.

Hark, hark!

Is it the sheep-bell among the ling,
Or the early milkmaid's carolling?

Hark, hark!

Or is it the lark,

As he bids the sun good morrow?

Good morrow,

Though every day brings sorrow!

The daylight is dying, the night drawing near,
The workers are silent, yet ringing and clear,
From the leafiest tree in the shady bowers
Comes melody falling in silvery showers.

Hark, hark!

Is it the musical chime on the hill,
That sweetly ringeth when all is still?

Hark, hark!

Oh! sweeter than lark

Is the nightingale's song of sorrow,
Of sorrow;

But pleasure will come to-morrow.

My next letter is to the same friend, and falls so naturally within the scope of my portraiture, that I feel much indebted for the copy.

Now that the weather seems breaking, dearest Mr. B—, I am beginning to think of all pleasant things; of primroses in the meadow, violets on the bank, sweetbriar at the garden-gate, and you, with your cheery looks and voice, here in my room. Well I know that you will come when you can, and you know that the flowers of May cannot be more welcome. I want cheering just now more than ever, for while there is no sort of change in my powers of motion, there is one much for the worse in another respect, this smoky, dusty room having greatly affected my eyesight. Well, we must hope. Everybody is kind to me as usual. Amongst the rest, your friend Delille. What I want of Lally Tolland is a memoir of his father, containing an account of his retreat from Pondicherry in 1761, and if he could procure me that work, or a sight of it, I would most gladly and gratefully pay all expenses. It is probably comprised in the memoirs of Plaidoyers, Paris, 1771, which forms one of the works in his list—a list more ample than that in the Biographie Universelle (6 vols. 4to, Paris, 1841), which has hitherto been the only one I have been able to obtain.

Will you have the great goodness to tell him this, with a thousand thanks on my part. What has become of the poem of which you promised me a slip? Lady Russell asked me yesterday when your poems would come out,* but I expect that new bridges are standing in the way, and I expect too much from that volume to hurry it. I have just been reading Mr. Justice Talfourd's new play, "The Cordiliere," printed, not published, and as yet, to use his own words, "a very private one," since he has not given it to a dozen persons. The subject is the revolt at Toledo headed by Podilla, in the early part of the reign of Charles the Fifth, and it is very beautifully written. Adieu, dearest friend.

Ever faithfully yours,

M. R. M.

* In the "Art Journal," published soon after her death, appeared "Recollections of Miss Mitford," from the pen of this gentleman, with additions by Mr. and Mrs. S. C. Hall, altogether a very interesting memoir. From it we gather that Mr. Harness was prepared to carry out her wishes by publishing her correspondence and collected works, but was baffled by the greediness of her two servants, to whom she had bequeathed her personality. It is to be hoped that with the mass of materials in his and Mr. Harness's hands, Mr. Bennoch may yet be enabled (though thirteen years have passed away since we mourned her death) to overcome this difficulty, and accomplish the fulfilment of a design so likely to be highly appreciated by the literary world.

* A design not yet carried into effect, and of the merits of which only an opinion may be gathered from some brief specimens in the recent publication of selections from modern Scottish songsters by Dr. Rogers, at Stirling.

Our next is still very miscellaneous, and exhibits more and more the grateful heart touched by every feeling, and the stirring mind alive to every incident that was passing around.

Thank you, a thousand times, dear friend, for your kindness about the oranges. I myself eat one a day, but one wants them sometimes for children, and perhaps to squeeze occasionally in water; so if they will keep a month, perhaps half a hundred once a month would be the right quantity. It is not like the same fruit with the trash sold in Reading, or even with some that a friend sent me this year from Covent Garden; but you have an instinct for the best in all things.

Once only that instinctive good taste has failed you. Appreciating heartily and gratefully the generous kindness which inclines you to do everything for those books of mine, I yet differ most entirely with you as to the common decency of my writing a notice of my own life for a newspaper. I would not do so were it certain to make the difference of the highest success or the most signal failure. I should as soon write a critique on my own works. The one would be as unseemly as the other. All that I can do is to furnish you with a list of publications. Correspondents are out of the question. It is wrong to drag one's friends into a matter of the sort. I could not put the dates of the play, every copy that I had having been sent to the printer's, so keep the dates back.

And once again I have to entreat you not to ask me to write *anything*. No; not a note merely. You would not if you knew the harm it does me. The position is so painful that it takes away my breath, and greatly aggravates for many hours that rheumatic pain which increases every day, and will, I suppose, finish in the heart complaint, which is its very frequent consequence. Every exertion, every fatigue, every excitement—above all, every worry, brings on more palpitation of the heart, which lasts for many hours. I see clearly that you have no notion of my bodily state. You judge (as people judge of the cheerfulness of the blind) by the good spirits which you see during the two or three hours enlivened by the rare delight of your company. The reaction of days and weeks you do not see; but I have a right to be believed when I tell you this, and I am sure that K—— and Sam (her maid and man servant) and Mr. May (her medical attendant) will tell you the same, because from my youth to this hour I have never spared myself. I have always been over-willing to exert every faculty, whether of mind or body. A year and a half ago I received, and did my best to entertain, Mr. Field and Grace Greenwood during such a state of fever that Mr. May (here at the time) wished to send them off, and that on their departure I took to my bed, which I did not leave for a month. I finished "Atherton" when very very few people would even have held a pen.

A word with you, my dear friend. I do wish that your visits should not be quite like those to a hospital. Do not retort this upon me, and do not force me into writing these unhappy truths again. Above all, treat me as a friend who loves you dearly and gratefully, and not as a machine for putting words together. Summer air may do me good, but till July or August the very air will be fatigue, and no amendment can be hoped for. God bless you. Do not be angry with me.

Ever yours,

M. R. M.*

These familiar letters, it is true, enter upon minute details, but they are The Life of a highly-popular national author, and from her own pencil. So she went on from day to day, cheered by good offices and elevated by the homage paid to her by friends of such station in rank and the world of letters, that she might well think their admiration was like "praise from Sir Hubert Stanley, praise indeed!" Then there came the flattery dear to literary fame,—pilgrims from foreign parts, who procured introductions to manifest their personal

respect for her and her writings. Two are mentioned in the last letter, and worthy of a note, namely, Mr. Field, the eminent publisher (Ticknor and Field) of Boston, himself a pleasing poet, and Grace Greenwood, the *nom de plume* of a very popular American authoress, of the genuine Mary Mitford ring, and well worth similar admiration across the Atlantic. Both were delighted with their visit, little suspecting that it cost their hostess so much.*

But withal, the asylum, whether from cares or sickness, which consoled and comforted her the most was that into which love of literary pursuits led the way: For though literature is,

Like the tempest-troubled ocean,
Sometimes high, sometimes low,

it has its quiet places, as the sea has its harbours, which the storms do not reach; and the author (sailor-like) finding nothing but pleasure there, forgets the toils and troubles common to every-day existence. And this is the undying resource of the ideal from the real: imagination creating its own bright sky to dwell in for a while, far above the gloom and shadows of the changing world. Devotedness to literature enjoys still more grateful solace than this in its disappointments and sorrows; for the genuine literary man or woman feels intensely that his or her toiling is not for self, but for the well-being of human-kind; a higher motive than the thirst for fame.

Well, but literary labourers are not all simplicity and honey. Though not armed, like trade, with "quills upon the fretful porcupine," they can sometimes wake up to take their own parts with their one quill after a fashion, and assert, or try to defend, their special worldly affairs. Mary Mitford, though a poet, was an active little body, and did not like to be put down or imposed upon. The following letter demonstrates this characteristic in her, and grieved am I to add that it also shows how severely the changes of fortune, to which I have reluctantly alluded, sometimes affected her moderate circumstances and disturbed the equanimity of her placid nature.

MY DEAR MR. JERDAN,—You will, I am sure, remember that you wrote to me on the part of Mr. Schloss, at whose request I edited for him the Bijou Almanack of the present year. Besides the usual quantity of verse, I wrote an introduction and some stanzas (not used on account of the plate not being finished), besides an advertisement in prose. In short, I did more than I stipulated to perform, although my dear father was slowly dying at the time, and it was with unspeakable pain and difficulty that I could raise my spirits to any literary exertion. I mention this to account for my applying to you in consequence of Mr. Schloss's unaccountable silence, who, upon my requesting him to transmit the money due, has not even thought fit to reply to my letter. Will you, should you be going that way, have the great goodness to tell him how much I should be obliged by his remitting the sum mentioned by you? I am most unwilling to trouble you, but circumstances compel me to make the application, my income

* This letter was in reply to one from Mr. Bennoch, who, seeing how her strength diminished, was anxious to obtain a list of her works, their dates of publication, and a few notes as to her own life. Although she scolded him, she nevertheless complied, and hence the accuracy of the brief biography in the "Fine Arts Journal," prepared by her friend and correspondent.

* In a series of Home Traits, it may be permitted to add any trifling anecdotes which may exhibit a feature of like characteristics from distant lands. Thus I remember Mr. Field, on a visit to me, passing nearly a whole night in a Kentish wood, listening for the nightingale, which he had never heard. They would not sing in consequence of the cold moonlessness of the season. Near the same spot, at a hayfield merry-making, the boys of the host, another poet (boisterous as usual), conspired to tumble an unlucky gentleman (selected on account of his wearing spectacles) and the good-humoured Grace Greenwood simultaneously into a hayrick, and throw armfuls of hay over them, amid shouts of laughter. In a momentary pause the voice of the smothering gentleman was heard to call out "More Hay"; and the joke was so relished that in a volume of Recollections published by Grace on her return home to America, she did not forget the droll and witty impromptu.

being so slender, and my health so uncertain, as to render even this trifling sum important to me in my present situation.

*Pray excuse my freedom
in obliging to you, I believe
me, my dear Sir, with every
good wish,
your obliged friend & servant
M. R. Mitford*

Three Mile Cross, near Reading,

July 4th, 1843.

Of course, if I do not speedily receive this money, I must make the matter known in other quarters less friendly.

Poor Schloss, whom I introduced to Miss Mitford at his request (when L. E. L. could no more give him her aid, which she had bestowed gratuitously), was a slow German, and had not appeared to time. I appealed to him, and he made amends. But his curious little almanack, about the size of a folio thumb-nail, did not latterly much profit the projector, whose fussiness about it was a trouble not small like itself, nor like Miss Mitford's notes in her correspondence, which were all written upon sheets (shall I call them) of letter-paper, four and a half by three and a half inches in length and breadth! And these were filled to the utmost, beginning at top, and ending in so crowded a conglomeration of words that the conclusion and signature were most difficult to decipher—her orthography throughout being (besides) rather a conventional formation of the letters than clearly legible. The above specimen is a favourable one.

Towards the end, after death had removed all her anxieties about her beloved father, the narrowness of means was so mitigated as never to be felt when limited to herself alone; but she suffered much from increasing ill-health and infirmities, and was brought to the condition which cannot be described in language more touching to the human heart than in this, our last letter.

MY VERY DEAR FRIEND,—You would hardly believe that our good friend in Cheapside wholly overlooked the article in the "Illustrated London News," and that I have only just seen it from a neighbour. He has, I believe, from the extracts in the advertisements, overlooked others in the same way. Well, let me talk of the article. It is so kind and so good that but for a little confusion of dates in the earlier paragraphs, I should certainly take it for yours; and the latter part I think certainly is—and so different from those feminine misdoings which I think you do not quite forgive my rating at their just value. Thank you a thousand times for all your kindness. I have had a most affectionate letter from my dear old friend, Dean Milman, who is now in Cornwall on his autumnal progress, this year to the Land's End, and will not get the books until he returns to St. Paul's. But as Arthur Stanley (one of the props of the "Quarterly") and Hugh Pearson have taken the Dramatic Works as their English book into Switzerland, there are good hopes that he may do it. They return the sooner (in three weeks) that my beloved friend may have a chance of seeing me once more—indeed he was most unwilling to go. I wish you had seen Hugh Pearson. He is exactly a younger Dr. Arnold, and has been to me spiritually a comfort such as none can conceive, such as none can be who is not full of tenderness and charity. I went to him for advice and consolation, and I found it (*sic*). I have always felt that his visitation was the great mercy of a most gracious God to draw me to himself. May he give me grace not to neglect the opportunity! Pray for me, my dear friends. We are of different forms, but surely of

one religion—that which is found between the two covers of the Gospel. I have read the whole thrice through during the last few weeks, and it seems to me, speaking merely intellectually, more easy to believe than to disbelieve; but still I am subject to wandering thoughts—flattering thoughts. I cannot realise ever that which I believe. Pray for me that my faith be quickened and made more steadfast. You will understand how entire is my friendship for you and my reliance upon yours when you read these last few lines. Mr. Pearson staid over Monday that he might administer the sacrament to me. I and one of my oldest and kindest friends, a daughter of Sir Mathew Wood, received it with us, although a nephew of her husband's had died that morning.

I go on gradually but steadily declining. All depends, humanly speaking, on nourishment.

Did I tell you of Appleton's application for my agency? God bless you!

Ever yours,

M. R. MITFORD.

A LADY'S JOURNEY THROUGH SPAIN.

CHAPTER IX.—XEREZ AND SEVILLE.

XEREZ I dare say my readers will recognise as the place whence comes the wine so universally known and drunk, namely, sherry. The name of the town in Moorish days was Sherish Philistin, and hence comes the name of the wine. Truly vines are everywhere in this curious place; hills covered with the precious plant surround the town. We are told that this famous wine was first brought into England in the reign of Henry VII, but it was then esteemed a great rarity, and more used as a generous cordial than as a beverage in common use. In Elizabeth's reign a far larger quantity was imported to England. When the renowned Earl of Essex took Cadiz he brought, on his return, some considerable quantity of what then went by the name of "sherris sack." In Spain it is still called "seco," and in France "sec." For a long time sherris, as it was for some time called, continued the fashion, and it was found in all the cellars of any note in the country. In the days of Lord Holland, to come down to modern times, it became quite the rage; for he was a great traveller in Spain, and brought back the very best wine that could be procured. Spaniards residing far away from Xerez rarely taste this wine in its best form, as all the best is sent out of the country.

No one who has not travelled in this country can imagine the picturesqueness of a Spanish vintage. The costume of the peasantry adds greatly to the general effect, and their animated language, their strong superlative expressions of delight at the beauty of the fruit, are all very entertaining to the by-stander. They are very superstitious, and nothing would induce them to begin the vintage on what they term an unlucky day, or without invoking the protection of one at least of their favourite saints. Instead of the violin that stimulates the exertions of the men who in France tread out the fruit, they employ a guitar; this, with the castanets played by a young girl, seemed to answer the purpose equally well. The Spanish wines are measured by what are called arrobas. This is a Moorish name and measure that has been retained through all the changes that have occurred in the country. It contains of our measures one quarter of a hundredweight. It seems almost incredible, but the statement was made to me by one of the greatest wine merchants at Xerez, and afterwards confirmed by the best authorities, that the annual growth of wine amounts to the vast quantity of 500,000 arrobas; thirty arrobas are equal to a butt of wine. Not more than one-third of the wine produced

ranks as first-class wine, what the Spaniards call "vino seco, fino, generoso;" which wine is very dear, costing rather more than half a dollar a bottle on the spot. We found that pure genuine sherry about twelve years old was worth from fifty-five to eighty guineas a butt in the bodega, or wine-store. When every expense has been added, the wine merchants importing the wine to England will have paid from one hundred to one hundred and twenty-five guineas for the butt before it reaches their cellars, and the butt will average about fifty-three dozen bottles. I dare say many of my readers will be surprised to hear that the excellence of sherry depends entirely on the care in the treatment of the wine introduced by different dealers; there are celebrated English, French, German, and Spanish wine merchants.

A bodega, or wine-store, is totally unlike our wine cellars, as it is always above ground. The external heat and glare are always carefully excluded, and it is like entering a delightful grotto. There are thousands and thousands of butts piled up in these stores, all in the most perfect order. There they remain during the rearing and maturing processes, as they are called. The sherry is entirely made from Xeres grapes; still it is made up from many different butts. The preparation of the wines is managed by the "Capataz," or head man. These officials are usually natives of the Asturian mountains; and their office is so important, that any one really practised in its duties, may ask nearly any remuneration he pleases. It is said to be rare to find these men perfectly honest, they have so much in their power; they generally end by cheating not only their immediate masters, but also the growers, who are far more difficult to deceive. The famous Amontillado is so called on account of the peculiar flavour of bitter almonds that it possesses. In all the celebrated bodegas a venerable butt of wine is always found; this is for the purpose of improving the young wines. The old butt contains the very richest wine that can be made. They have a curious custom amongst the growers of calling these butts by different celebrated names, such as Nelson, Wellington, Ferdinand, etc., etc. Rarely is the name of a French celebrity chosen, so intense is the dislike felt for the French people by the Spaniards. The vineyard we visited the most frequently during the vintage was beautifully situated, and in admirable order. Enormous fortunes have been made and also lost in the wine trade; nothing can guard the dealers from the vicissitudes of the seasons, and a vintage looked forward to as one of no common promise may totally change its character from causes which to the unenlightened would seem of no moment. The Spanish vines are trained more like the vines in Italy than either like French or German vines; they are left to grow more freely and luxuriantly, and are trained on trees of a moderate height, but not allowed to grow vagrantly. When the white, green, and purple grapes are ripening, and the heavy bunches weigh down the branches, the sight is most pleasing. In old Spanish romances it is said, "Golden is the grape that grows by the Guadalite," showing that the fruit was as celebrated in the olden time as in the present. A railroad now conveys these precious butts of golden liquid actually on board the vessels that are to convey them to foreign parts.

The Spanish vineyards have the same peculiarity as the French ones, viz., that they are left entirely unclosed. When the fruit begins to ripen, fields near the roads are chosen, and there temporary sheds and awnings are run up, and huts are sometimes built with reeds or boughs. In these is placed the vinadero, or watch-

man; he is armed with a long gun, and he creeps in and out, constantly on the watch, like a watch-dog. If he sees any one approaching he rushes forth with the utmost fierceness in defence of his charge. The way-faring Spaniards, tired, hot, and dusty, long eagerly for some of the refreshing fruit; every practised stratagem, every crafty trick, is essayed to deceive the wary guardian, but in most instances without effect.

Xerez is a curious old town. It ceased to belong to the Moors in 1264. The alcazar is a beautiful specimen of a Moorish fortified palace, with its numerous turrets and picturesque ornaments. The great merchants do not live actually in the town; they very wisely eschew the narrow gloomy streets, with nothing to recommend them but their picturesque air of antiquity, and they have made their homes in the suburbs. Most luxurious are their princely residences, combining every comfort and every attraction that money can purchase, or that can be found in that bright southern land. But I have lingered long enough at Xerez, and must continue my story.

After leaving Xerez we were delighted with the variety and beauty of the wild flowers that grew in abundance over a plain called La Llanura de Caulina. The scene was thoroughly Spanish; no living thing was to be seen, but these beautiful blossoms covered every part of the plain. It would be a rare field for botanical researches. We were told that at a certain season of the year the beautiful lilac iris grew there in profusion, giving its own bright colouring to the ground, so thickly did it cover the plain; and later on, the seed, in the form of clusters of bright scarlet berries, would be nearly as ornamental. Many of the flowers were entirely unknown to me, but there were brilliant cyclamens with their crimson blossoms, many of the cistus tribe, and others too numerous to mention. Flora might well hold her court there! Very loth we were to leave all this beauty. We did pause for a considerable time, and loaded our baskets with the different specimens, but there was a limit to our coachman's patience and we found we had reached it.

Alcala de Guadaira is remarkable as being literally the bakehouse of Seville; it is quite near to it, but what originally gave rise to the bread for the consumption of Seville being all made at Alcala I could not make out, though I made many inquiries on the subject. Such bread I certainly never tasted anywhere else, and as Spanish bread was famous even in the days of the Romans, one must suppose that the talent for making it in such perfection has been handed down from generation to generation. Every one in Alcala seemed to be employed in the business. The grain is thrashed in the most primitive way in the open air, and in consequence it gets mixed with earthy particles which it is the business of women and children to separate from the corn. We visited one of the large baking-houses, and saw the proceedings from first to last; in kneading, the dough is worked and reworked with much patient care. Every morning at a very early hour the bread is taken into Seville. There are between fifty and sixty ovens in Alcala. The castle of this bread-making town is most interesting, one of the finest Moorish relics to be seen in Spain. From its situation its possession by an invading army was necessarily most important, and in consequence the castle must have been of great strength in order to resist the constant attacks. The subterranean corn granaries (mazmorras) and the cisterns are very curious. Alcala is as famous for the clearness and purity of the water as for the fineness of the bread it furnishes. The excavations into the very

heart of the rock are most picturesque; they date from the time of the Moors, and the crystal streams are conveyed from Alcala to Seville by an aqueduct.

It is impossible by any language to give the reader any real idea of the beauty of Seville, as amidst orange and lemon groves I first saw it rising with its golden towers out of the plain below us. The day was closing

and advantage should visit it many times. Above all, visit it in the evening, when the last rays of the sun, or rather the last glimmer of the daylight, is shining through its painted windows, or again at night when its various chapels are partially lighted up, and its immense aisles dimly illuminated by rows of silver lamps.

There was one sight I was never tired of contem-

AQUEDUCT NEAR SEVILLE.

in, so that the scene had every advantage from the light of the setting sun, and the season also was most favourable for a first visit to this enchanting spot. My companions, who were then seeing for the first time the wonders of southern vegetation, were in continual transports. We drove to the Fonda de Madrid, where a kind friend had secured rooms for us. He possessed one of the most beautiful houses in Seville, where he always came for the winter and spring, and in the course of a few days he laid us under still further obligations, by placing another private house entirely at our disposal. This house, or rather villa, although within less than two miles of Seville, was as solitary as it would be at fifty miles distance from a town in any other country, and nothing reminded us of the vicinity at night but the deep melodious chimes of the cathedral bells.

The character of the city is very peculiar, and there is a strong Moorish colouring evident, go where one will. The churches furnished us with continual banquets; they are very rich in paintings, and I am inclined to think it gave all the greater zest to our enjoyment to feel that, unlike the great Italian paintings that have been admired and talked of till one is almost weary of the subject, these paintings are comparatively but little known to the world at large. The cathedral is indeed glorious, but any one wishing to see it to ad-

plating, the Moorish tower of the Great Mosque, from which the muezzin of old called the faithful to prayer. It is upwards of 250 feet in height, without the beautiful belfry, which was added at a much later period. We were fortunate enough to be at Seville at one of the great church festivals, when this beautiful belfry, with its open filigree-work, is brilliantly illuminated. The effect of such a mass of light at that height, suspended as it seems in mid-air, with no apparent connection with the earth, is indescribably beautiful. The top of the Giralda is the abode of a perfect colony of the smaller hawks; they wheel their airy flight about the tower. (*For view of the Giralda, see p. 392.*)

Seville is the very focus as it were of the adoration of the Virgin. All the ceremonials, all the processions, pictures, statues, and engravings, are in connection with, and in honour of the Virgin. Some of the processions, we were told, were very picturesque, and they are most frequent in winter, and usually at nightfall. All the balconies of the houses before which the procession passes are illuminated, and the uncertain gleams of light that shine on the long treble ranks of the devout worshippers give a singular effect to the varied dresses of the crowd. They chant fine old hymns, and the united voices, as the sound rises and falls upon the ear, thrill through one with a very powerful effect as the centre of the pro-

cession draws near. We had an opportunity of hearing this fine chanting or singing of old hymns in a musical celebration that occurred during our stay, and I could therefore well imagine the thrilling effect of the voices heard at night. The gorgeous lamps used in the churches are seen casting bright rays on all the sumptuous dresses of the priests, who of course take part in the pageant; and the most splendid silken banners, one mass of gold and silver embroidery, are waved aloft, all gathered round the central banner on which the figure of the Virgin is represented. No sooner has the long stream of the procession passed by than every light is extinguished, thus keeping up the idea that the sacred banner sheds light and brightness along the way it traverses, while darkness closes in on those regions not blessed by its presence. The ceremonies during the Holy Week, as they call it, are said to be second only to those at Rome in the magnificence of the arrangements, decorations, and pomp.

The number of convents and other religious establishments that formerly existed at Seville seems almost incredible; it is stated as high as between 150 and 200. All are now in a measure dismantled and turned to other uses. This universal destruction of these venerable establishments gives an air of melancholy desolation.

The Moorish decorations in the alcazar, or royal palace, are unique, and many of the most beautiful have been admirably restored, chiefly by removal of the whitewash from the gilding and from the delicate colouring. Don Pedro the Cruel was one of the great restorers of this interesting old palace. Most of the celebrated Spanish sovereigns resided here. Charles V was married in the alcazar to Isabella of Portugal. The grand court is magnificent, but the rooms looking to the garden are the gems of the whole building in my opinion. In some of the gardens at Seville the orange-trees, without exaggeration, attain almost to the size of large trees. The myrtles also are beyond description beautiful.

The museum at Seville is with good reason considered the best in Spain. Here are some of Murillo's exquisite pictures, especially one of the Virgin and Child, called *La Servileto*, because it was originally sketched on a dinner napkin; the figure of the Holy Child is very highly praised by the best judges.

Any one who likes getting into odd corners, and finding out striking little bits of scenery for himself, may have his taste amply gratified at Seville in the Jews' quarter, "*La Juderia*." It is rich in the most picturesque scenes; such houses, such gateways, such arches, such balconies as are not to be seen elsewhere. The establishment of *Laundresses* is also a most picturesque scene; it is in *El Corral del Conde*.

We were rather disappointed in the beauty of the women of Seville. There were beautiful women there, no doubt, but they were more the exceptions than the rule; the generality of female faces we saw there were sunburnt, and singularly devoid of freshness and bloom.

One excursion we made down the river to an old convent, called *San Juan de Alfara*. It is built among the ruins of an old Moorish castle, and we spent the evening at a charming country seat in the neighbourhood, which had also been a Moorish retreat in days of yore. In those country seats one continually meets with relics of Moorish labour and taste, channels cut in the sides of the hills through the living rock in search of choice springs of cold and delicate water, and basins and fountains to collect it, and to cool the courts and halls of the mansions.

But we had already reached the middle of September, and it was necessary to make preparations for our onward progress. We reflected that more than two-thirds of the time allotted to our stay in Spain were gone, and we had yet much to see before our tour was completed. We were to go to Madrid, pausing only a short time at Cordova.

One spot in the environs of Seville it was impossible to pass by without a shuddering feeling of horror seeming to pervade one's whole being. I allude to the plain just outside the walls, called *El Prado del Sebastian*, where were enacted all those awful and guilty tragedies connected with the Inquisition. There the miserable victims of a narrow-minded and most ferocious bigotry met their death. The gloomy fires of the Inquisition were constantly lighted on that spot, and the traces of the terrible scenes enacted upon it are not left entirely to the imagination, for there are still to be seen the marks of the places where the foundations of the square platform were raised on which the faggots were placed.

MY FIRST CURACY.

CHAPTER XIII.—THE CURATE'S PETS.

THAT "man was not made to live alone" is a trite truism. Start not, fair readers, and think that I am going to indulge in a piece of sentimentalism, and introduce you to some, or rather to one, of the numerous young ladies of my acquaintance. My narrative is not a novel, but merely a record of dry, true facts. But many a man who cannot afford to marry and settle, and who tires of being always at his work and his books, must seek some relaxation in his leisure hours. It will not do to keep the bow always strung. How often has this been felt since I have become a metropolitan curate, with not many minutes to spare from dawn till night! Health gives way, and usefulness is at an end, under the strain of incessant toil.

When I was in the country I amused myself with keeping various pets, including a dog, a number of good white *Cochin China* fowls, a canary, an aquarium, and a tame pike. A short description of the last shall come first.

An artificial pond had been made in the vicar's garden for the purpose of supplying the house constantly with water. I have mentioned previously that the village was only supplied by little running brooks from the Tors and from small hill-side springs. A young pike was procured to cleanse the pond from all impurities, such as beetles, lizards, and the like insects and reptiles which inhabit stagnant fresh sheets of water. He fulfilled his appointed task so effectually that he himself soon needed to be artificially fed. This I undertook to do, and every morning when I went to the pond I nearly always found him in one identical spot. If he was not on the surface of the water, he would immediately rise and begin to wag his fins and tail with delight in anticipation of the coming banquet.

In the course of a few weeks he would follow me round the pond, and a little later he would allow me to tickle his back and sides with a slender twig. I managed to retain him as a favourite for three years. Each winter he used to disappear for nearly three months, and when he reappeared in the early spring he looked all the worse for his long fast, for I suppose he went to sleep in the mud at the bottom of the pond for that period. When he again awoke up his appetite was enormous, as if he intended to make up for lost time, and he would easily

swallow eight or ten good-sized frogs as his daily meal.

One day, unfortunately, I tried the experiment of seeing if he would take and eat one of those disagreeable-looking brown land lizards, which are commonly found under trailing plants in a damp situation; so, having caught one of these newts, I first threw into the pond two or three frogs, which the pike greedily and quickly devoured; I then threw in my lizard, when it was as quickly captured and swallowed as the frogs had been, perhaps because it was thought to be one. A bad and fatal result attended my experiment. In about half an hour after seizing the lizard the fish began to swim about the pond as if in the greatest agony, increasing his speed each hour, and even lashing the water and covering it with foam by the impetus of his movements. I was really quite dismayed at the issue of my thoughtlessness, but powerless to render any assistance. The next day the pike, having completely lost his natural colour and exchanged it for a dull leaden one, turned over and died. When I had rescued it from the water it weighed four and a half pounds. The cause of its death, I suppose, was poison from the lizard it had devoured.

Of course my dog was of all my pets my especial favourite, being the most intelligent. He was my constant companion in my walks, and in my parochial visits, though, from his showing a decided enmity towards cats, he sometimes brought us both into trouble. He was a mongrel-bred dog, though the skye terrier predominated. He was a very faithful watch, and possessed of no ordinary cunning. Among other capabilities, he could sham illness to perfection. When he wanted to gain what I had denied him, he would go to the side of the room, and there lean his head against the wall and turn up his eyes until nothing but the whites of them remained visible. And if, when in this position, I began to pity him, he would shake and tremble all over, so that a spectator would imagine he was going to die in convulsions. But, as I have already said, these shams were only put on to gain a desired object. For instance, if I had denied his accompanying me in a walk, he would begin to act in the above-mentioned way. If I told him he might go out along with me, no sooner had the words escaped my lips than he would jump about so furiously with delight, and wag his tail, and make such a disturbance, that he would forget everything about his pretended illness. I suppose he at first expected I would have to stay at home with him. He did not try the trick when he saw I knew what he was up to.

The clerk's wife gave him to me as a puppy, and he always retained great affection for her. If he could steal away from the parsonage and get to her house he would be quite delighted and perfectly satisfied. On these solitary journeys he never travelled by the ordinary road, fearing, I suppose, lest he should be stopped and brought back; but to avoid such a catastrophe he would go to the clerk's house by way of a long ditch overshadowed with fern and brake, and then skirting the village in a roundabout manner, he would jump a high wall and alight in the garden, and thence sneak into the house, where he would rest content till I called for him to take him home. But, on the other hand, if I called *with* him, and wished him to stay there while I paid parochial visits, nothing would induce him to remain: why, I know not.

With respect to my aquarium, it was a source both of much amusement and instruction to myself, as hundreds who possess a properly ordered one can well suppose.

The interest is much heightened if all the inhabitants of the aquarium have been procured by the personal exertions of the owner. Give me a good clean ditch, or a shallow pond, and then I have a fund of amusement for hours together. Often when the old people of the village passed me as I was groping and poking about the side of a pond with my can and my nets, they smiled at my enthusiasm, and wondered what I could see in a pond that was worth all this searching. Nevertheless I persevered, and even induced several of the young people to find specimens for themselves.

A caution or two I would venture to tender to those wishing to form aquariums. Never crowd your tank with too many inhabitants. Insects, like human beings, thrive best with plenty of air and space.

The next important thing in regulating an aquarium is to discover what species will best agree together in the same globe. Now the golden carp and the common little stickleback will by no means do together, for the latter will soon destroy the former, chasing them incessantly about the aquarium, and trying to pierce their enemies' sides with the sharp thorn, or horn, that they are able to erect and thrust out from their own sides. They remind one very much by their motions of what we read of a combat between a sword-fish and a whale; for the poor gold-fish are just as defenceless against the attacks of the sticklebacks, although they are only the size of their tails, as are the whales against the persevering attacks of their foes.

Again, the larger striped black-beetle should never be put into the same aquarium with fish of any kind, for they will soon attack and kill the fish, especially tench or roach, by biting them under the belly.

I could tell many interesting anecdotes about my aquarium and its inhabitants, but I will only on the present occasion relate two. Mine was a large one, and possessed a vast variety of insects, who, from my constant vigilance, lived somewhat in the same relation towards one another as do the indwellers of those cages entitled "happy families," seen about the London streets. Among other things I had a quantity of the larvæ of the dragon-fly, and a number of those beetles which are popularly known by the name of "boatman." These were always at variance one with another; perhaps, more properly speaking, I should say they were engaged in an exterminating warfare. I did not find out this at first, but saw that daily the number of each species was rapidly decreasing. So I resolved to watch and discover the cause. Sitting down quietly, I soon perceived a "boatman" beetle sink to the bottom of the aquarium, and then proceed to carefully survey the surrounding neighbourhood. Presently a larva of the dragon-fly peeped very cautiously out of some weeds, and commenced to crawl along for a little way towards the beetle, and then halting, remained motionless. It was, however, soon perceived by the beetle, who advanced circumspectly to the fray. The two insects crept gradually towards each other, until the distance between them was diminished to about an inch. There they remained without the slightest outward sign of movement for a few minutes; when the larva, darting forth a tongue somewhat like the ant-eater's, as it advanced to the attack, seized the beetle with it, and in a second or so, so very short was the interval, the beetle was torn in pieces and eaten on the spot.

In this same aquarium the larger kind of water lizard, commonly called the great black triton, strove to become master over all the tribe of lizards: and its enmity, or appetite, was especially directed towards a small buff-coloured lizard, which the black triton

frequently swallowed to the extremity of its tail. The words "frequently swallowed" may surprise the readers of this anecdote; but I declare that it is true, for I have seen the buff lizard in the throat of the larger triton for upwards of eight hours at a time, and at the end of that period it has been released apparently without injury.

CONCLUDING REMARKS.

By the time the readers of these papers have got so far, they will have become acquainted with a few of the disjointed incidents of my first curacy, the particulars of which have been rather hastily jotted down. In this curacy I served my apprenticeship in the ministry of the Church of England. I remained in it seven years—seven of the best years of my life, as regards physical strength. In such perfect harmony did my vicar and myself work, that during the whole of the seven years we had not a single serious disagreement. The little varieties of opinion between us on some occasions were caused by the interference of another, who should have been the very last to have tried to engender strife.

I thankfully acknowledge that in this retired pastoral Devonshire parish I enjoyed much hospitality, and received many kindnesses, especially from those ladies who assisted in the parish, to whom I have already alluded, and also from two or three of the farmers.

But I should not be honest, nor would this narrative be truthful, if I did not also confess that in this parish I met with many trials and was caused much needless sorrow. Some of the vexations which befell me were no doubt brought about by my own errors of judgment; but whether I succeeded or failed in the various undertakings I set on foot, I can conscientiously say that I laboured hard during the time I was resident among the people, with an earnest desire to promote the spiritual and temporal welfare of all classes.

Upon looking back upon these seven years one acknowledges that if this time could be recalled a different line of action might have been chosen in conducting many schemes of usefulness in the parish; but this being simply a vain and fruitless complaint, the past must live to speak for itself. A day will come when the work will be tried by its results, and I, as other curates, must stand or fall by that verdict. Be this as it may, very grateful am I for the experience I bought in my first curacy—grateful to my fellow-helpers in their labour of love, and grateful above all, I hope I am, for that protecting, guiding Hand which sustained me in times of trouble, cheered me when cast down, and strengthened me when fainting under a sense of my awful responsibility in the work of the ministry.

JAMES BRAITHWAITE THE SUPERCARGO.

CHAPTER XVII.

I WENT down into the captain's cabin, and, awakening him, told him what the surgeon had said.

"Mutiny!" he exclaimed, as he dressed himself with the usual rapidity of a seaman. "We will soon settle that matter." He stuck his pistols into a belt he put on for the purpose, and took a cutlass in his hand. "Here, Braithwaite, arm yourself," he said. "Tell the officers to do so likewise. We will soon see which of the two, that sea lawyer or I, is to command the *Barbara*."

Telling Gwynne and Toby to guard the arm-chest, and Randolph to rally round him the most trustworthy men on deck, he desired Stubbs and me to follow him forward. Without a word of warning he suddenly appeared among the men, who were supposed to be in their

berths asleep. Going directly up to the berth Badham occupied, he seized hold of him and dragged him on deck, with a pistol pointed at his head, exclaiming at the same time—"Shoot any one who offers to interfere."

The captain was very confident that he had the ringleader, and that the rest would not move without him. "Now!" he exclaimed, when he had got him on the quarterdeck. "Confess who are your accomplices, and what you intended to do! Remember, no falsehood! I shall cross-question the others. If you are obstinate, overboard you go."

Badham, surprised by the sudden seizure, and confused, was completely cowed. In an abject tone he whined out, "Spare my life, sir, and I will tell you all."

"Out with it then," answered the captain. "We have no time to spare."

"Well, sir, then I will tell you all. We didn't intend to injure any one, that we didn't, believe me, sir; but some of us didn't want to go back to Sydney, so we agreed that we would just wreck the ship, and as there are plenty of seals to be got hereabouts, go sealing on our own account, and sell the oil and skins to the ships passing through the straits, and, when we should get tired of the work, go home in one of them."

"And so, for the sake of gaining a few hundred dollars for yourself, you deliberately planned the destruction of this fine ship, and very likely of all on board. Now, understand, you will be put in irons, and if I find the slightest attempt among the crew to rescue you, up you go to the yardarm, and the leader of the party will keep you company on the other."

Badham, in his whining tone, acknowledged that he understood clearly what the captain said, and hoped never again to offend. On this he was led by two of the mates to one of the after store-rooms, where he could be under their sight when irons were put on him, and he was left to his meditations, the door being locked on him. The next morning the crew went about their work as usual, Badham's dupes or accomplices being easily distinguished by their downcast, cowed looks, and by the unusual promptness with which they obeyed all orders. The officers and I continued to wear our pistols and side-arms as a precautionary measure, though we might safely have dispensed with them.

A short time before this, in 1802, a settlement had been formed in Van Diemen's Land, and lately Hobart Town, the capital, had been commenced. It was, however, a convict station, and no ships were allowed to land cargoes there except those which came from England direct with stores or were sent from Sydney, in consequence of which restriction the colonists were several times nearly on the point of starvation.

The heads of Port Jackson at length hove in sight, and we entered that magnificent harbour, the entrance to which Cook saw and named. Wanting in his usual sagacity, he took it for a small boat harbour, and passed by without further exploring it. Having first brought up in Neutral Bay, that we might be reported to the Governor, we proceeded some miles up to Sydney Cove, where we anchored in excellent holding ground about half-pistol-shot from the shore. Sydney had already begun to assume the appearance of a town of some consideration, and contained fully 5,000 inhabitants, though still called the camp by some of the old settlers. As to the houses, however, except the stores and public offices, the greater number, eight in ten at least, were of one story, and were, for the most part, composed of wattle and plaster, although a few were of brick and stone. It is divided into two parts by a river which runs into the cove, and affords it unrivalled advantages

of water communication. Several settlements in the country had already been established, among the chief of which were Paramatta and Hawkesbury. The latter settlement is about six miles long, and about forty miles from Sydney; vessels of two hundred tons can ascend by the river up it a distance of at least forty miles. The town, such as it then was, covered about a mile of ground from one end to the other, and already gave promise of becoming a place of considerable extent. A wise and active governor, Lieutenant-Colonel Lachlan Macquarie, had ruled the settlement for about a year, during which period it had made rapid progress. The previous governor was the notorious Captain Bligh, whose tyrannical conduct when in command of the *Bounty*, produced the disastrous mutiny which took place on board that ship. The same style of conduct when governor of New South Wales, especially in his treatment of Mr. John McArthur, the father as he was called of the settlement, induced the colonists to depose him. The officers and men of the New South Wales corps marched up to the Government House, and, after hunting for him for some time, found him concealed under a bed. His person and property were, however, carefully protected, and he was shortly afterwards put on board the *Porpoise* sloop-of-war, and sent off to England. The settlement, however, quickly recovered from the mismanagement of this unhappy man, and was at the time of my visit in a flourishing condition.

Nearly up to this time the colonists had been in a constant state of dread of starvation from the want of meat and corn. Live stock had now so greatly increased, and wheat was grown on so many farms, that all fear on that score had vanished. A manufactory of coarse woollen cloth from the country wool had been established, and both linen and canvas had been made from the country flax. A coarse kind of pottery was manufactured at Paramatta. A water-mill, the only one in the colony, was nearly finished. Curing and table salt, which will not liquefy, was made at Sydney, and in the same place a manufactory for hats was established. A school also had been opened on the Lancastrian system, each pupil to pay one shilling per week. Altogether it will be seen that the settlement had by this time made great progress, while the governor was making tours of inspection to ascertain what further benefits he could confer on it.

I was fortunate in disposing of the larger part of the cargo under my charge at good prices. Hassall and I agreed, however, that more might be done for our owners, and we proposed, therefore, visiting some of the islands in the Pacific, and either returning home the way we had come, or continuing on round Cape Horn. We had not been long in harbour before O'Carroll made his appearance on board. He had brought the ship of which he had taken charge in safety into harbour, when the emigrants presented him with so handsome a testimonial that he resolved to settle in the colony and lay it out to advantage. The governor had made him a grant of a large extent of farm land, and assigned him some twenty convict servants, land in those days being given away to free settlers, and labour of the nature I have described found them gratis.

"Altogether I am in a fair way of some day becoming a rich man," he observed, "the which I should never have been had I continued ploughing the salt ocean. Besides," he added, with a twinkle in his eye, "how do I know, if I did, that I should not some day fall into the clutches of that fearful little monster La Roche; and if I did, I know that he would not spare me. Do you know that even to this day I cannot altogether get over

my old feelings, and often congratulate myself as I ride through the bush that I am far out of his reach?"

O'Carroll kept to his resolution, and became a very successful and wealthy settler. I frequently received letters from him after my return home. In one of them he told me that he had had a surprise. The governor asked him one day, as he could speak French, whether he would like to have some French convicts assigned to him. He had no objection, as he thought that he could manage them easily. What was his astonishment when the party arrived at the farm, to recognise among them, in a little wizened-looking old man, his once dreaded enemy La Roche! He determined to try and melt the man's strong heart by kindness. At first he was almost hopeless in the matter, but he succeeded at last. La Roche confessed that he had placed himself within the power of the British laws in consequence of a visit he paid to England after the war, for the purpose of carrying out a speculation which ended unfortunately. It was satisfactory to hear that he lived to become a changed man, truly repenting of his mis-spent life, and thankful that he had been spared to repent.

I have not spoken of the would-be mutineer, Badham. It must be remembered that he had committed no overt act of mutiny, and though Captain Hassall was perfectly right in putting him in irons, he could not have been brought to trial on shore. The day before we reached Sydney he pleaded so hard to be forgiven, and so vehemently promised amendment in all respects, that the captain resolved to give him a trial. It must be confessed that he was not altogether disinterested in this, as it would have been impossible to get fresh hands at Sydney, the temptation to settle in the country having by that time become very great, so that it was with difficulty we could keep several of our people who had come from England.

Once more we were at sea. We touched at Norfolk Island, to which convicts from New South Wales were sent. It seemed a pity that so fertile a spot, so perfect a little paradise, should be given up for such a purpose. We obtained here a supply of vegetables and pork, which were not to be got at that time at any price at Sydney. After a rapid voyage from this lovely little island we anchored in Matavai Bay, in the island of Otaheite. It was at an interesting time of the history of the island and its king, Otoo, who since the death of his father had taken the name of Pomarre. For many years the band of zealous missionaries who had come out in the ship *Duff* had laboured on among the people, but though they taught the king, the young prince Otoo, and some of their people, to read and write, they confessed that they had not made one satisfactory convert. In 1808 the greater number of the missionaries retired from Otaheite to the island of Huahine, and the following year all the married ones left that island for New South Wales, in consequence of the wars in which the king was constantly engaged, the destruction of all their property, the risk they ran of losing their lives, and the seeming hopelessness of introducing Christianity among such a people. After an absence of between two and three years, several of them, having wished to make a fresh attempt to carry out the work, sailed from Sydney for Tahiti, but stopped at the neighbouring island of Eimeo, where the king was residing, as Tahiti was still in a state of rebellion. They taught the people as before, and now some began to listen to them gladly. They still seemed to have considered the king as a hopeless

heathen; but misfortune had humbled him, he felt his own nothingness and sinfulness, and the utter inability of the faith of his fathers to give him relief. After the missionaries had lived in the island about a year, the king came to them and offered himself as a candidate for baptism, declaring that it was his fixed determination to worship Jehovah, the true God, and expressing his desire to be further instructed in the principles of religion. The king proved his sincerity, and ever after remained a true and earnest Christian. He still resided at Eimeo, but a considerable number of people in Tahiti had by this time been converted, and the old heathen gods were falling into disrepute.

Now I take this opportunity most emphatically to declare my conviction, from my own experience and from the evidence of other disinterested witnesses, that the accounts of the happy change brought about by the labours of missionaries in the South Sea Islands, as well as in other parts of the world, are perfectly and substantially correct. At the same time, owing greatly to the direct encouragement given to vice by our own so-called Christian seamen who navigate those seas, the ports, like those of England or other parts of Europe, contain many profligate persons. But the character of the islanders must not be judged by these. It cannot be too often repeated that in those places frequented by European seamen the greatest drawback to the progress of the Gospel among the natives is the pernicious example set them by the nominally Christian visitors.

So devastating had been the character of the late wars in Tahiti, that we found it impossible to obtain supplies, and we therefore sailed for Ulitea, the largest of the Georgian group, where we were informed that we should probably be more successful. No sooner had we dropped anchor within the coral bed which surrounds the island than the king and queen came off to pay us a visit. They were very polite, but not disinterested, as their object was to collect as many gifts as we were disposed to bestow. This island was the chief seat of the idolatry of the Society Islands. It was looked upon as a sacred isle by the inhabitants of the other islands of the group, and more idols existed and more human sacrifices were offered up than in all the others. We were so completely deceived by the plausible manners of the king and queen and those who accompanied them, that the captain and I, the surgeon, and two of the mates, went on shore to visit them in return, accompanied by several of the crew, leaving the ship in charge of Mr. Randolph, the first mate. We fortunately carried our arms, though deeming it an unnecessary measure of precaution. The king had an entertainment ready for us, and afterwards we were allowed to roam about the island wherever we pleased. I observed the people at length pressing round us, and not liking their looks, advised Captain Hassall to order our men to keep together, and to be prepared for an attack. Whether or not they saw that we were suspicious of them we could not tell, but from this time their conduct changed, and they would only allow us to proceed in the direction they chose. At length, however, we got down to the landing-place. As we approached the boats we saw a band of armed natives making for them. We rushed down to the beach, and reaching the boats just before they did, we jumped in and shoved off. These savages, though savage as ever, were also more formidable enemies than formerly, as many of them had firearms, and all had sharp daggers or swords.

On reaching the ship we found that Badham and his

associates had, soon after we left, seized a boat, and, in spite of all Mr. Randolph could say or do, had taken all their clothes and other property with them, and gone on shore. Although by this conduct Badham showed that he could no longer be trusted, and therefore that we were well rid of him, it was important that we should get back the other men, and we agreed to go on shore the next morning to recover them. Accordingly, the chief mate and I went on shore as we proposed, with eight well-armed men, and demanded an interview with the king. He did not come himself, but sent his prime minister, who agreed for six hatchets and a piece of cloth, to deliver them up. We waited for some hours, but the deserters were not forthcoming, and at last the minister and another chief appeared, and declared that as the men were likely to fight for their liberty, it would be necessary that we should lend them our arms.

"Very likely, indeed, gentlemen," answered Mr. Randolph, at once detecting the palpable trick to get us into their power.

"I say, Braithwaite, what say you to seizing these fellows and carrying them on board as hostages? It could easily be done."

"Cook lost his life in making a similar attempt, and we might lose ours," I answered. "I would rather lose the men than run any such risk."

In vain we endeavoured by diplomacy to recover the men, and at last we returned on board, the minister losing the hatchets and piece of cloth. A feeling of anxiety prevented me from turning in, and I walked the deck for some time with Benjie Stubbs, the officer of the watch. At length I went below and threw myself on my bed, all standing, as sailors say when they keep their clothes on. I had scarcely dropped asleep, when I was awoken by hearing Stubbs order the lead to be hove. I was on deck in a moment, followed by the captain and the other officers.

"We are on shore to a certainty," exclaimed Stubbs, in an unusually agitated tone.

"Impossible!" observed the captain, "the anchors are holding."

"We'll haul in on the cables and see, sir," answered Stubbs, calling some of the crew to his assistance. The cables immediately came on board. They had been cut through. Still there was a perceptible motion of the ship towards the shore. Another anchor with an iron stock was immediately cleared away, but some time was lost in stocking it, and before it could be let go we felt the ship strike against a coral reef with considerable force. Happily there was no wind, or she would speedily have gone to pieces. At last we carried the anchors out, and hauled her off, but not without unusual difficulty. Suddenly the captain jumped into a boat, and pulled round the ship.

"I thought so!" he exclaimed; "the villains have fastened a rope to her rudder, and were towing us on the rocks." He cut the rope as he spoke, and with comparative ease we got the ship out of her perilous position. Still she was so near the high cliffs which almost surrounded us that we might be seriously annoyed, not only by musketry, but by stones and darts. It was evident, also, that should a breeze set in from the sea, the single anchor would not hold, and that we must be driven back again on the coral rocks.

We were not left long in doubt as to the intention of the savages and the deserters their instigators. Suddenly, fearful shouts burst from the cliffs above us, and we were assailed by a fire of musketry and by

darts and stones hurled on our deck. To return it would have been useless, for we could not see our enemies. Meantime we kept the men under cover as much as possible, and got another anchor stocked and ready to carry out ahead. The savages must have seen the boat, for as soon as she was clear of the ship they opened fire on her, and it was not without difficulty that the anchor was carried out to the required distance, and the crew of the boat hurriedly returned on board.

Owing to Badham's machinations, some of the crew had at first been disaffected, but a common danger now united them, as they saw full well the treatment they might expect should the savages get possession of the ship. Besides the ship's guns we had four swivels, thirty muskets, and several blunderbusses and braces of pistols. These were all loaded and placed ready for use, with a number of boarding pikes, for we thought that at any moment the savages would come off in their canoes and attempt to board us. The whole night long they kept us on the alert, howling and shrieking in the most fearful manner. Soon after day broke their numbers increased, and as they could now take aim with their firearms our danger became greater. Fortunately they were very bad marksmen, or they would have picked us all off. Strange as it may seem, no one was hit, though our rigging and boats received much damage. After the crew had breakfasted, we sent two boats out ahead to tow off the ship, but the bullets and other missiles flew so thickly about them that they returned, the men declaring that the work was too dangerous. However, Benjie Stubbs, jumping into one of the boats, persuaded them to go again, while we opened a fire from the deck of the ship. As soon as the savages saw us ready to fire, they dodged behind the rocks, so that none of them were wounded. Still we hoped that by this means the boats would be allowed to tow ahead without molestation. We were mistaken, for the savages shifted their ground, and once more drove the boats on board. We clearly distinguished Badham and the rest of the deserters among the savages, and several times they were seen to fire at us. Happily they also were wretched shots, and their muskets thoroughly bad also. That they should venture to fire showed that they had no doubt of getting us into their power, for should we escape and inform against them, they would run a great chance of being captured and hung. Later in the day, Toby and I again made attempts to tow out the ship from her perilous position.

The savages all the day continued howling and shrieking and working themselves into what seemed an ungovernable fury, while they were, however, biding their time, knowing that probably a strong sea-breeze would soon spring up and cast the ship helpless into their power. Thus another night closed on us. Ere long great was our joy to feel a light air blowing off the shore. The pauls of the windlass were muffled, and not a word was spoken. The anchors were lifted, the top-sails were suddenly let drop, and slowly we glided off from the land. The weather becoming very thick and dark, we were compelled again to anchor, lest we might have run on one of the many reefs surrounding the island. Here we remained on our guard till daylight, when we could see the natives dancing and gesticulating with rage at finding that we had escaped them. The favourable breeze continuing, we were soon able to get far out of their reach, I for one deeply thankful that we had not only escaped without loss ourselves, but without killing any of the unhappy savages. The treatment we received was such as at that time might have been ex-

pected from the inhabitants of nearly all the islands of the Pacific, including those of New Zealand, and numberless were the instances of ships' companies and boats' crews cut off by them.

A very few years after our visit, this very island was brought under missionary influence, the idols were overthrown, heathenism and all its abominable practices disappeared, and the inhabitants became a thoroughly well-ordered, God-fearing, and law-obeying Christian community. The same account may be given of the larger number of the islands which stud the wide Pacific, and ships may now sail from north to south, and east to west, without the slightest danger from the inhabitants of by far the greater portion of them.

But it is time that I should bring my narrative to a conclusion. This adventure at Ulitea was amongst my last. Finding that our trading expedition to the Pacific Islands was not likely to prove of advantage to our owners, Captain Hassall and I resolved to proceed home at once round Cape Horn.

We happily accomplished our voyage without accident and without any further occurrence worthy of note. Our path was no longer beset by hostile cruisers, for there was a lull in the affairs of Europe. After the many excitements of the past few months, the days seemed long and tedious as I had never known them before; and it was with a sense of relief as well as of real pleasure, that I again saw in the early morning light the shores of old England looming clear in the distance. I need not dwell on all the happy circumstances of my return, or on the special satisfaction with which I looked again on one familiar face. Suffice it to say that I had the gratification of receiving the commendation of my kind friend Mr. Jarrin for the way in which I had carried out his instructions and performed my duties as a Supercargo; and that this voyage prepared the way for more substantial proofs of his favour.

MUSEUMS AS AIDS TO EDUCATION.

IN his inaugural address as President of the British Association at Norwich, Dr. Hooker gave the following valuable hints on the educational uses of museums:—

Much as has been written upon the uses of museums, I believe that the subject is still far from being exhausted; for in the present state of education in this country, these appear to me to afford the only means of efficiently teaching to schools the elements of zoology and physiology. I say in the present state of education, because I believe it will be many years before we have school masters and mistresses trained to teach these subjects, and many more years before either provincial or private schools will be supplied with such illustrative specimens as are essential for the teacher's purposes.

Confining myself to the consideration of provincial and local museums, and their requirements for educational purposes, each should contain a series of specimens illustrating the principal and some of the lesser divisions of the animal and vegetable kingdoms, so disposed, in well-lighted cases, as that an inquiring observer might learn therefrom the principles upon which animals and plants are classified, the relations of their organs to one another and to those of their allies, the functions of those organs, and other matters relating to their habits, uses, and place in the economy of nature. Such an arrangement has not been carried out in any museum known to me, though partially attained in that at

Ipswich. It requires some space, many pictorial illustrations, magnified views of the smaller organs and their structure, and copious legible descriptive labels; and it should not contain a single specimen more than is wanted. The other requirements of a provincial museum are—complete collections of the plants and animals of the province, which should be kept entirely apart from the instructional series, and from everything else. The curator of the museum should be able to give elementary demonstrations (not lectures, and quite apart from any powers of lecturing that he may possess) upon this classified series, to schools and others, for which a fee should be charged, and go to the support of the institution. And the museum might be available (under similar conditions of payment) for lectures and other demonstrations. Did such a museum exist in Norwich I am sure that there is not an intelligent schoolmaster in the city who would not see that his school profited by the demonstrator's offices, nor a parent who would grudge the trifling fee. You boast of a superb collection of birds of prey; how much would the value of this be enhanced could there be seen near to it such an illustration of the nature, habits, and affinities of the *raptores* as might well be obtained by an exhibition of the skeleton and dissected organs of one hawk and one owl, so laid out and ticketed that a schoolboy should see the structure of their beak, feet, wings, feathers, bones, and internal organs—should see why it is that hawks and owls are pre-eminent among birds for power of sight and of flight; for circling and for swooping; for rapacity, voracity, and tenacity of life—should see, in short, the affinities and special attributes of birds of prey. This, which refers to the teaching of natural history, is an operation altogether apart from training the minds to habits of exact observation, which, as is now fully admitted, is best attained in schools by Professor Henslow's method of teaching botany. Excellent manuals of many branches of geology are now published, which are invaluable to the advanced student and demonstrator; but from which the schoolboy recoils, who would not refuse to accept objects and pictures as memory's pegs, on which to hang ideas, facts, and hard names. To schoolboys, skeletons have often a strange fascination, and upon the structure of these and the classification of the vertebrata much depends. What boy that had ever been shown their skulls would call a seal or porpoise a fish, or believe a hedgehog could milk cows, as I am told many boys in Norfolk and Suffolk, as elsewhere, do believe implicitly? A series of illustrated specimens, occupying some 5,800 ft. of wall-space, would give at a glance a connected and intelligible elementary view of the classification and structure of the whole animal kingdom; it would stand in the same relation to a complete museum and *systema Naturæ* as a chart on which the principal cities and coast-lines are clearly laid down does to a map crowded with undistinguishable details.

Much of the utility of museums depends on two conditions often strangely overlooked—their situation, and their lighting and interior arrangements. The provincial museum is too often huddled away, almost out of sight, in a dark, crowded, and dirty thoroughfare, where it pays dear for ground-rent, rates, and taxes, and cannot be extended; the object, apparently, being to catch country people on market days. Such localities are frequented by the towns-people only when on business, and when they consequently have no time for sight-seeing. In the evening, or on holidays, when they could visit the museum, they naturally prefer the outskirts of the town to its centre. Hence, too, the

country gentry scarcely know of the museum's existence; and I never remember to have heard of a provincial museum that was frequented by schools, but rather the contrary. I do not believe that this arises from indifference to knowledge on the part of the upper classes or of teachers, but to the generally uninteresting nature of the contents of these museums, and their uninviting exterior and interior. There are plenty of visitors of all classes to the museums at Kew, despite the outer attractions of the gardens.

The museum should be in an open grassed square or park, planted with trees, in or in the outskirts of the town, a main object being to secure cleanliness, a cheerful aspect, and space for extension. Now, vegetation is the best interceptor of dust, which is injurious to the specimen as well as unsightly, while a cheerful aspect and grass and trees will attract visitors, and especially families and schools. If the external accessories of provincial museums are bad, the internal are often worse; the rooms are usually lit by windows on one side only, so that the cases between the walls are dark, and those opposite the window reflect the light when viewed obliquely, and when viewed in front the visitor stands in his own light. For provincial museums, when space is an object, there is no better plan than rectangular long rooms, with opposite windows on each side, and buttress cases projecting into the room between each pair of windows. This arrangement combines economy of space with perfect illumination, and affords facilities for classification. Upon this plan the large museum in Kew is built, where the three principal rooms are 70ft. long by 25ft. wide, and each accommodates 1,000 square feet of admirably lighted cases, 6,700ft. of wall-room for pictures and for portraits of naturalists, besides two fireplaces, four entrances, and a well-staircase, 11ft. each way. A circular building, with cases radiating from the wall between the windows, would probably be the best arrangement of all. A light spiral staircase in the centre would lead to the upper stories. Two or more of the bays might be converted into private rooms without disturbing the symmetry of the interior or intercepting the lighting of the cases. The proportions of the basement and first floor might be such as to admit of additional stories being added, and the roof be so constructed as to be removable without difficulty when an additional story was required; furthermore, rectangular galleries might be built, radiating from the central building, and lit by opposite windows, with buttress cases between each pair of windows.

In respect of its natural history collections the position of the British Museum appears to me to be a disadvantageous one; it is surrounded by miles of streets, including some of the principal metropolitan thoroughfares, which pour clouds of dust and the product of coal combustion into its area day and night; and I know few more disappointing sights, to me, than its badly-lit interior presents on a hot and crowded public holiday, when whole families from London and its outskirts flock to the building. Then young and old may be seen gasping for fresh air in its galleries, with no alternative but the hotter and dustier streets to resort to. How different it would be were these collections removed to the townward end of one of the great parks, where spacious and well-lit galleries could be built, among trees, grass, and fountains; and where whole families need not any more be cooped up for the day in the building, but avail themselves of the fresh air and its accessories at the same time as they profit by the collection.

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper.*

A SUDDEN ACCIDENT.

THE EXILES OF SALZBURG.

CHAPTER III.

At the commencement of this narrative, Hans was described as a stout and ruddy youth; now, a few weeks later, and on the point of quitting the Shippen, he had become evidently pale and wasted.

"Whither away, Hans?" said Barbara, in a soft and melancholy tone, which detained him. She herself best knew how to give the answer to this question.

Almost speechless, and without raising his eyes to the maiden's countenance, he replied,

"Up to the Alp to relieve Veit!"

"Never before were you in so great a hurry," remarked Barbara, looking bashfully on the ground.

"Yes, once—it is true—but now," he said, with a profound sigh, "my heart becomes lighter only when I am away; so farewell, Barbara." He slowly proceeded to depart, but without stirring an inch farther.

"You might fetch me," rejoined Barbara, lowering her voice—"you might fetch me a few pails of water to sprinkle the linen." Hans stood irresolute, with his head inclined towards the maiden, then laid his stick and bundle carefully down, and obediently went to a

neighbouring cistern for the water. At last the quietness with which the water was brought by Hans, and the linen sprinkled by Barbara, became insupportable to the latter, who at length said, "But perhaps you do not like the task?"

"Oh, why not?" he replied, summoning all his fortitude. "Why should I not cheerfully assist in bleaching the linen for thy marriage portion, so that the wedding may be the sooner?"

"Hans! this from thee!" and he observed a large tear rolling down her cheek.

"Barbara!" said Hans, tremulously. The long restrained sorrow in the youth's breast burst forth, and he desperately bit his lip as, with sobs, he continued, "Let my tears fall upon thy bridal linen, Barbara, and then it will be bleached sooner than with cold water. And if thou cuttest the cloth and my heart in twain at the same time, should there be any to spare—oh, give it me for a winding-sheet!"

"How have I deserved this from thee?" exclaimed the afflicted girl, in a paroxysm of grief.

"And when the pipers and fiddlers," continued Hans, without remorse, "are merrily playing the wedding dance, I also shall be dancing with an airy companion on the Wenger Alp! Then, when thou shalt proceed into thy nuptial chamber with thy beloved, be not alarmed shouldst thou hear a light knocking at the window. It will be my last farewell! Adieu!" Still he went not. "But," he again resumed, "what shouldst thou care for a poor youth like me? Thy proud cousin, who will one day occupy this fine estate, is a very different suitor, even if he limped and squinted ten times worse, and his hair were still more fiery coloured."

"Go on, go on!" said Barbara, warmly, "vex my heart, Hans, and then my sufferings will be at an end."

Hans looked upon her sorrowful countenance, and his heart was softened.

"Say thyself, can I do otherwise," she demanded, reproachfully; "must I not obey my father, who daily urges me to marry my cousin? must I not listen to my mother, who entreats me earnestly to do so? Am I not much more unhappy than thou art? Thou canst find sufficient consolation in thy holy book, but to me it is forbidden. But do pray earnestly and diligently; thou hast thyself advised me to do so."

"That I will, indeed," said Hans, piously; "I will pray for thee, and for thy happiness, my good Barbara."

"And I," replied the latter, drying her tears, "will tell my cousin that I cannot bear him; that I only take him on the compulsion of my father's command; and then let him do as he pleases."

"Yes, do!" began Hans, but all at once he hastily seized his bundle, and with hasty strides he was out of sight.

Barbara soon comprehended the reason of his very abrupt departure, when she perceived her intended bridegroom limping towards her through the opposite gate. Hans had not exaggerated the unsightliness of his personal appearance. The damsel awaited him with the composure and resolution with which she was inspired by her late conversation with Hans. The bridegroom, though yet at a distance, descried Barbara, and opening his capacious mouth to its full extent: "Ha, ha! ha!" exclaimed he, laughing, "thy father will wonder where I am gone! He has been dragging me over hedge and ditch, through thick and thin, over ploughed land and marshy meadows, discoursing to me about the management of this ground, and the improvement of that. It was very tedious, but I limped bravely

along. However, I watched my opportunity and luckily slipped away. Ha, ha, ha! what a search he will make for me, whilst I am sitting sheltered by my dear Barbara's side!" As he concluded, he pinched the cheek of his bride elect, and put on a fond and love-sick look, which bore, it must be confessed, resemblance to the grinning of a satyr.

Barbara disengaged herself from the clumsy fingers of her intended, and anxiously gazed at the spot whence Hans had disappeared. She now stood undecided in what manner she should put into execution a design which she had formed. Her cousin, feeling himself highly flattered by her remaining near him, resumed the conversation.

"I do not comprehend," he said, shaking his head, "what possesses thy father, to be so determined to make a farmer of me. He has been aware from my earliest years that I find no pleasure in it. On this account he never liked me, but was well satisfied when I took it into my head to become a carpenter, for by that means the house was freed from my presence. At that time thou wert a little squaller, about so high. Oh! who would have thought that we should ever become such a stately couple? When I returned from abroad thy father would scarcely receive me, and now all at once—but I am a great gainer by it, and well satisfied. Sit down by me, dearest."

"I have no time," replied Barbara. "I must sprinkle the linen."

"It will not run away," said Peter. "Come, then, and I will tell thee how I intend to arrange my daily work for the future. I shall never rise early, or else I should require two breakfasts every morning; thus one will suffice for me, but that must be a very good one. After that I shall take my gun and saunter about the thickets and fields, looking after the labourers. Precisely at mid-day I shall come home to dinner, and that over, I shall take a nap for a few hours. If the weather be bad, too hot, too dry, too stormy, or damp, I shall stay at home, and pass away the time at my work-bench until the evening meal. After that I shall go to the ale-house, and at last—"

"But," began Barbara, hesitating.

"No buts," said Peter. "Thus it will be, and no otherwise, as sure as my name is Peter."

"But if I now tell thee that—that—"

"Well, what, my dear?"

"That I do not—not at all—like thee, that I should be happy if thou wouldst seek another wife."

"Ha, ha, ha! wouldst thou?" but suddenly changing his tone, "Well now, look! there is our foolish Hans! When I was coming in at one gate, he ran out at the other. I thought that by this time he must have been some miles off, and there he stands with his eyes and mouth wide open, staring at us over the wall."

But Barbara was unable to look in that direction; heaving a sigh, she took the watering-can and continued sprinkling the linen, completing a task she abhorred.

CHAPTER IV.

THE wedding-cakes were baking in the oven; oxen and fowls were slaughtered; the house and yard were swept and decorated. The wedding dress lay ready. Hans, in despair, was on the Alp. Peter seemed in an ocean of delight. The mother wore a look of anxiety. Barbara sat with wan and faded countenance.

Such was the state of the Shippen on the eve of the marriage. The bride, making her escape from her talkative mother, hastened into the garden and sought

refuge amongst the close overhanging elder-trees to give vent to her oppressed heart in unrestrained tears. She sighed for immediate death; in her deep distress she failed to hear the loud confused hum of numerous voices, which approached nearer and nearer to the Shippen. The voices became still more distinct; but Barbara noticed them not, until a sound in unison with her feelings, the lamentation of a person in suffering, reached her ear. Then it was that she looked up. With a face besmeared with blood and dust, his clothes torn and covered with mud, Peter was limping at the head of a multitude of people, in the midst of whom was carried a man severely wounded, and who seemed struggling with death. An indescribable pang pierced Barbara's heart. Hans! had he committed suicide? a quarrel with Peter! these were the frightful thoughts which assailed her mind. But soon she reproached herself bitterly, for it was with diminished grief that she observed the wounded man was not Hans—no, it was her father.

"The Warden!" cried a hundred voices, as wife and daughter threw themselves upon the unconscious sufferer—"The Warden is to blame, who placed him on the most dangerous part of the timber raft."

Messengers were despatched in haste for a surgeon; mother and daughter washed the blood from the wounds of the poor sufferer with trembling hands. In vain did Peter cry out that the cakes in the oven were burning to cinders; nobody heeded him, no one could now laugh at his ridiculous gesticulations.

By the application of simple remedies the unconscious Manlicken was brought to his senses. As he faintly opened his eyes he cast a bewildered look upon the group of bystanders, and raising his finger in a menacing attitude, he said with great difficulty, "Thou fool! this night shall thy soul be required of thee." His whole countenance wore a look of intense sorrow, and again he closed his eyes. "He is delirious," said some. "He means the Warden," said others.

But Manlicken, whom they believed had again fainted, shaking his head to reprove their mistake, pointed to himself. This voiceless act produced redoubled lamentations amongst his family. During this mournful scene Peter was busily engaged out of doors, tossing the charred wedding cakes out of the oven upon the grass in utter despair, as he reflected that, under existing circumstances, the wedding was not likely to take place on the morrow.

MOTHER'S WORK;

OR, THE EDUCATION OF THE HEART.

BY MRS. ELLIS, AUTHOR OF THE "WOMEN OF ENGLAND."

CHAPTER V.—LAW AND ORDER.

THAT would be a happy era in our history, an omen of the true prosperity of our country, that should be marked by a noble resolution on the part of mothers generally to educate their children themselves—that is, up to a certain stage, when the discipline of numbers may be necessary to prepare the child for entering upon life as an independent but still responsible being. In all instances where this is the case—and there are such instances standing out before the world as examples of high attainment—I believe that the reward to the mother has been more than commensurate for her trouble, and the advantage to her children beyond all calculation. For how is it possible that any stranger can understand so well that deepest yet most delicate of all mysteries, the heart and mind of a child? How

can a stranger know as the mother knows, the peculiarities of each individual child, its capacity and incapacity, its points of susceptibility, its constitutional tendencies, its inlets for the entrance of knowledge, or its mode of receiving impression? and who can care for all these, and ponder them in the heart, like a mother? There is no picture presented by the whole of life more beautiful than that of a mother educating her own children—really educating them, intellectually and morally, through all the early stages of youth, and making this great purpose of her existence of such paramount importance, that it is not in the power of any inferior claims upon her time or attention to interfere with or set it aside.

Let us consider how closely the mother's task may come to that which is generally understood by education, without imposing upon her the duty of giving direct lessons. As children advance from infancy, their lives naturally and necessarily branch out, and grasp simultaneously such material as serves to furnish both head and heart, and as their powers expand, these become so blended that in the general character of youth they work and grow together.

One of the first stages of this kind of blending is that in which a child discovers that it is a social being, and necessarily subject to laws which, though not always pleasant to the individual, are good for the community of which that individual forms a part. This is a hard lesson, difficult to teach, most difficult to learn. It is generally taught at school by the discipline of numbers, and the sharing of a common lot amongst many similarly circumstanced. But there are two ways of understanding this lesson, a high way, and a low way; and whatever else we do with children, I repeat that we should keep them high, never degrade them. The high way of which I speak is this, to be made to see that law and order are absolutely necessary where numbers are concerned, because they secure property, preserve rights, prevent quarrels, and induce, when rightly regarded, a constant and habitual reference to the good of others, of the family, the community, or the state. The low way is that which consists in calculating that if I do not observe this law or rule, I shall get into a scrape; and it is needless to say how much this method of learning to observe law and order prevails in schools.

There is a strong individuality about children that is much opposed to that sharing of a common lot which must be, some time or other, the discipline of all lives worth living. This individuality prevails not only in childhood, but with all ignorant and unthinking persons. It requires considerable enlargement of heart, as well as extension of thought, rightly to feel how we are situated with regard to our fellow-beings, and what are the duties involved in our social position. The little child sees only itself, that centre of importance, and of intense and absorbing interest; and long after the stage of infancy, the same tendency remains, the same egotism, the same self-centring of all calculations, but especially such as relate to enjoyment or suffering.

We cannot justly call this individualism selfishness, strictly speaking, because some who are remarkable in this way are generous in giving and sharing. It is rather an absence of regard for what is due to others, which ought to be corrected in the child even before it leaves the mother's care, and corrected in the higher way of learning the value of law and order as they affect others, as well as ourselves, not in the way of learning merely to obey law as a means of avoiding disgrace or punishment.

The blind obedience of the nursery does not teach this lesson. Although so necessary in itself, it only teaches that a condition of absolute obedience is really the happiest, as well as the best, for all creatures while incapable of observing truly and thinking rationally—such creatures as would injure or destroy themselves from ignorance of things destructive—in short, for all creatures that have to act under wisdom superior to their own, or under authority which they have no power to overthrow, and no right to dispute.

Children, and ignorant persons generally, are apt to doubt such wisdom, and to rebel against such authority. They see it in a personal point of view, and resist it with a personal dislike. Here the nature and the absolute necessity of law should be brought in to supersede this personal feeling, by making it clear to the child that there must be law and order, and that he who observes both not only serves his own interests, but promotes the welfare of the whole community of which he forms a part.

With boys especially the nature and the claims of law require to be clearly understood. Girls are more influenced by those of order; but it would be well if both could be brought before the consideration of youth in a manner more likely to excite an intelligent interest than is generally the case. To obey law and observe order, is thought sufficient for the young, and well indeed would it be if this desirable end could always be attained. The life-long labour of those who have to maintain law and keep order in schools, sufficiently testifies to the absence of all education of the heart in these matters, except in very rare and happy instances.

Lessons on these subjects are certainly more easily taught at school than at home, where domestic arrangements and habits, unconsciously formed, regulate the routine of daily life. But it is useless to speculate upon what might be done at school in the way of introducing a different order of lessons, bearing more upon the circumstances of actual life in which youth will have to take a social as well as an individual part. It is useless—but let us hope only for the present useless—to dream of what might be done in this way towards sending out better members of society, men impressed with the value of moral law, and women capable of producing this impression on the hearts and lives of their children.

To obey the laws of a school is generally accepted as sufficient even for youth considerably advanced beyond childhood. No matter how blindly these are obeyed. No matter how their enforcement is attributed to the personal will, or the personal spite of the teacher. No matter how they are secretly evaded, provided only that they are publicly and openly observed. No matter how the moral nature of a child is suffering under this external aspect of unbroken law, nor how he is living in a state of spiritual rebellion.

To obey and to conform, this is what is required, and this must be insisted upon at any cost. Unquestionably it must, so far as this, that neither in act nor in spirit must rebellion be allowed to exist. But I am speaking of methods by which rebellion in spirit might be prevented, not merely rebellion in act kept down. I am speaking of a desire to conform to existing law because it is useful and good, being made to spring up in the heart of a noble and intelligent youth; and it is needless to say that this can never be effected by a system of blind obedience. Blind obedience was for the child during its life in the nursery. It is still for the youth to obey, but not blindly. Indeed he must obey the

restraints of society, of the people, and the circumstances amongst which he lives. If properly instructed in the nature and purpose of law, he will see that he must do this; but if that simple obedience which was fitted for the child in the nursery be extended and imposed as an unexplained necessity upon the thinking and intelligent youth, how can he, under such a system, be said in any sense to be learning that great lesson of life—how to govern himself? He is only *being governed*, and that is a totally different matter. The boy who is required to render a blind obedience up to the verge of manhood may possibly never again be required absolutely to *obey* in the whole course of his life. He may thenceforth have to govern, and what can he know of government, who has never understood, nor indeed been taught to understand, those laws by which his own life has been regulated.

If any one doubts whether or not the character and conduct of a child can really be effectually reached by a different mode of training from that usually pursued, let them try the experiment upon two or three thinking children at school, or if not at school, in some way or other situated amongst numbers, and subject to social law. Let such children be admitted to the confidence of those who govern this community, so far as their rules tending to social order are concerned. Let them be consulted as to the right or wrong working of some established rule; and it should always be borne in mind that those who are subject to the laws of a community are really better judges of their right or wrong working than are the authorities who enforce them, and who merely look on, as it were, from without. Children or young persons thus consulted as to the abrogation of an old, useless, or oppressive law, and made parties to the establishment of a new and better one, will naturally feel themselves pledged to keep that unbroken; and if of a noble nature, and well trained at home, will thus become animated with a generous enthusiasm to make sacrifices, if necessary, of personal gratification for the general good.

For all this the mother may prepare her child, although for the practical working-out of such plans or modes of training for after life, a community is required like that existing in schools. But if in this respect the mother stands at a disadvantage with the school-teacher, she has greatly the advantage in hers being a heart work. It is true that one of the great obstacles to the training of home is that none of the children of a family stand on common ground. Each is older or younger. Not even two of the number can be on exactly the same level as at school, and afterwards in society, where people live and act in classes subject to common laws. Hence home training can never in this respect be a true and practical preparation for after life. Hence then the value of schools, if they could only be made to affect the heart as wisely and as faithfully as they now affect the head.

In considering the subject of order, and how its value might be taught to the young, it presents this difference from law—that while the theory of the latter conveys to the mind of youth an idea of something severe and uninteresting, the former, being obvious to the senses, may be brought under a very different aspect, and presented as an essential part of the beautiful in nature and art.

My acquaintance with human life, and especially with life in its early stages, leads me to believe that there is, as the phrenologists tell us, a distinct faculty of order. It is true that order may be taught, it may also be enforced, and so made a habit; but to love order for its

own sake, to delight in it where it exists, and to be made miserable by disorder, belongs, I think, to some natural conformation, in the same way that a musical ear belongs to some individuals, though scarcely, perhaps, in so distinct a manner.

With those who naturally delight in order, it is a pleasant task for the educator or the companion of youth to point out the beauty of order as illustrated in the works of creation—as illustrated also in all branches of art, but especially in sculpture and architecture. It is pleasant also to point out the social uses of order—the comfort, the safety—the economy of time and means which is secured by its observance in our domestic arrangements, and in all those transactions which place us in relation to others.

But there are, unfortunately, cases in which this love of order does not exist naturally, and then what is the mother to do? what is any one to do? What, especially, can be done with girls, who absolutely *must* observe order? Boys without this natural faculty are generally let go. It seems to be taken for granted, particularly in the families of the poor, that boys can do without order, perhaps because the world is abundantly supplied with women to gather up, arrange, and make orderly what men leave otherwise; and it is astonishing what pains are taken amongst women of this class, both mothers, wives, and sisters, to maintain a kind of domestic tyranny on the part of men by their treatment of boys, and of slavery on their own part, with the privilege of occasional rebellion.

A little higher in the range of intelligence, the same exemption from the law of order at home seems still to be allowed to boys, with a kind of vague belief that the occupations of boys in general will effect the desired result; and indeed there is much to do this in their games, and still more in their scientific pursuits, which have a tendency to make them exact in manipulation, without which no one can be skilful in execution; and thus a certain observance of order is acquired even without the natural love of it, and without any perception of its intrinsic beauty. This habit may exist without any reference in the mind of the child to the comfort or convenience of others, and hence without any idea of the value of order as a principle. The mother's especial work is to produce the same results by higher and better means, and thus to make what she accomplishes a thing of enduring—nay, of eternal value—by giving to a simple act a far reaching motive, such as falls in legitimately with the whole course of Christian life.

But if it is imperative upon girls that the minute, as well as the greater affairs of their lives should be marked by a strict regard for order, and this because they have so much to do with and for others, they have this advantage on their side, that they are generally quick to see and feel what is beautiful, or the reverse. Once convince a girl that her disorderly habits create absolute ugliness, and consequently excite feelings of disgust, and she will experience a wholesome check, although by being worked upon merely in this, which I have called a negative manner, she will only be checked; she will not be inspired as she ought to be with a heart-warm love of order for its own sake, and a consequent desire to regulate her conduct by the laws of order for the sake of others.

In pursuing her interesting work, the mother will find sometimes, perhaps to her own surprise, that motives which have great force when placed before one child produce no effect whatever upon another. In the study of her children's characters, however, she will find out and learn to understand the peculiarities of their separate

natures, and so will be able to use one class of motives in influencing one child, and a different class with others. To a lover of the beautiful in nature, and a despiser of order in domestic life, it might perhaps be well to point out, and at suitable times expatiate upon, the wonderful observance of order in the creation, in the seasons with their regular return, in the flowers and fruits of the earth, in the revolutions of the heavenly bodies, and, in short, in all that is minute and exact, as well as all that is majestic and sublime, in the visible universe of God. It might be well to ask of such a child, or in some way to put her upon thinking, where would be the beauty, the grandeur, and the beneficence of all this display of wisdom and power, if the law of order should cease to be observed, if another day should fail to dawn, if spring should fade and wither and give place to winter, or if any of those steadily recurring events upon which we hang our faith until they become household proverbs, should fail at their appointed time and place, and thus overthrow the whole system of which they form a part.

Another child might be shown—and indeed the lesson is important for all—that social happiness is to a great extent dependent upon order; that it is an almost inevitable consequence of disorder that grievous mistakes are made; while delays, disappointments, quarrels, separations and enmities, are the frequent attendants upon habitual disorder.

I once knew a young lady of a generous and noble disposition who had no natural love of order, and in whose case it seemed impossible to compel her to observe it. In vain was the beauty of order in the creation pointed out to her. This made no difference, any more than pointing out the desirableness of order in her own personal habits. At last her friends hit upon the expedient of blaming the little coterie with whom she was associated for the general state of disorder with which she appeared well satisfied to be surrounded. This aroused her attention; and while deepening the impression by showing her how this would always be the case in after life, that others would share the blame of her want of order, the heart of the generous girl was touched with a sense of the injustice of which she would thus be guilty, and she set about from that time to labour at being orderly—for it was labour to her—as diligently as many labour at some difficult accomplishment.

The heart of a girl may generally be reached by some reference to the bearing of her actions and character upon the tastes or feelings of others. Order comprehends many points, on the observance or non-observance of which may depend much happiness or misery to our friends.

Punctuality is a branch of order. "I only kept you waiting five minutes," says a girl who began late to prepare, and who, like many late beginners, has suffered from the loss of half the things which she thought she could have laid her hands upon in the dark, and the loss of her temper besides. "I only kept you five minutes." Yes, but if five people besides herself are concerned, the entire loss of time is twenty-five minutes, or rather, including herself, it is thirty minutes—a good half-hour of precious time, of which she has absolutely robbed her friends; and the robbery is the more serious because time is a treasure which she can by no possibility restore to them. She has taken it by her own will, cast it into the past, and it is gone for ever. Neither they nor she can bring the treasure back. The composed manner and pleasant air with which certain young persons can do this, is something wonderful

to behold. One can only conclude in charity that they have never had the subject pressed upon their attention truly and faithfully. They have probably never realised their position as social and responsible beings, never understood that we can none of us live alone unconnected with others—only for ourselves.

In many of the higher ranges of instruction, especially such as require a technical knowledge of what is taught, there are mothers who would be greatly at a loss in undertaking the education of their children, because of the defective nature of their own preparation for this task. But let such mothers take courage from this fact, that there are just modes of thinking which are quite within the range of their abilities, and that to teach a child to think rationally and justly on matters intimately connected with human character and conduct, is of more consequence to that child than to teach it to decline a Greek or Latin verb. A woman may think rationally and rightly on many subjects without being eminent as a scholar. She may have used well those quick powers of observation with which most women are gifted by nature. She may have listened well, read well, and thought well; and if I am not greatly mistaken, the mother who has done this will be a more intelligent and useful instructor of her children than one who, without having done this, may have passed a learned examination and received academical honours.

There are many subjects on which, if a mother has observed and thought rationally, she may help a child in regard to its future career—its place in the world as a good citizen, and a good Christian, and perhaps in no case more essentially than on those which relate to social duty. The government of different countries, political measures, national and individual rights, with many other important and comprehensive considerations, appear to me to belong more or less to this subject, and may be so treated as to introduce collaterally to the mind of a child much that we deem most interesting both in history and experience.

Nor let the mother in the commencement of this task despise such humble means as have been placed within her reach for teaching the simple lessons of a noble life. A great principle may be involved in a small act, and habits, apparently unimportant in themselves, may develop into conduct illustrious for truth, dignity, and heroism. Her work, being a heart work, must necessarily begin early, and practically it must begin indeed so simply as to look, to the unconcerned observer, scarcely worthy of serious attention. Let us take an example of this from that selfishness inherent in children, which is with them a natural and legitimate principle of action.

While the child is very young, many efforts which it would otherwise shrink from are cheerfully made, and even persevered in, for the sake of some gratification to self. A sturdy little boy will fetch out his own toys for a favourite game, even when panting under the fatigue of carrying them. He does this for himself, but in ninety-nine cases out of a hundred, somebody else carries the toys away, and puts them in their places. The fetching is for self, the carrying back is for others, that they may not be inconvenienced or annoyed. Is it from the child's innate selfishness, or is it from the want of proper training, that the carrying back and putting away of the toys is so much more difficult than it was to bring them?

Whatever the cause of this difficulty may be, I cannot but think that a wholesome and useful lesson on social duty might be made out of this simple matter of fetching for self, and carrying away for others; that a

child might be so taught as to receive in this way a clear idea, and perhaps his first, of the laws which govern society, and which he will have to observe through the whole of his after life.

That the teaching of this lesson would be much more irksome to the instructor than it would be to put away almost any amount of toys with her own hand, I do not for a moment doubt. That is not the question. Neither is it so much the question whether in every case this particular act shall be done or not. But it is a question, and a very important one, whether or not the child shall learn to take pleasure in, and esteem it an honour to do, such little acts of service to those amongst whom he lives. In the little heart, even of a boy, there is sometimes a real happiness derived from the idea that he *helps*. Yet how little is made of this in the boyish character; how little is it trained so as to constitute an essential element in the character of a true man and a gentleman!

The first working of those laws by which society is held together, by which order is preserved, and justice and right maintained, is, I think, best understood by reciprocity, or, in other words, by showing how, if we behave well to society, it will behave well to us; if we insult, annoy, or inconvenience others, they will exercise but little concern as to how we are insulted, annoyed, or put to inconvenience ourselves. Very early in life a child may be made to understand something of this—so far, at least, as to comprehend that law by which a borrowed article must be returned uninjured. These, with many other lessons of the same tendency, will present themselves to the mind of a thoughtful mother in the performance of her ever varying but always interesting task.

And an interesting task indeed is that which the mother has before her. It is the dry bones of learning, and the bare details of unexplained duty enforced without motive or purpose, which make both so dull and wearisome to the teacher and the taught. When the breath of moral and spiritual life is breathed into that which the mother works with, it becomes instinct with meaning and with power to help in the carrying out of the highest purposes of human existence.

It may seem but a little thing that the child in the nursery should carry back his toys, as well as bring them out; but when the child has grown to manhood, it will be a great thing for him—whether prince or peasant, statesman or soldier, merchant or artisan—that he has learned to see the value of law and order as they affect the welfare of a family, a people, or a state; and it will be a great thing for him, and for all with whom he may be associated, that he has learned the golden rule of doing to others as we would that they should do to us.

A LADY'S JOURNEY THROUGH SPAIN.

CHAPTER X.—LA MANCHA.

WE had hired a very commodious carriage to take us to Madrid, making a pause at Cordova. The weather was most delightful, similar to our finest summer weather, but with a light exhilarating air that made everything seem enjoyable to us.

Let me here say, for the sake of those seeking a desirable residence for invalids, that I have been in all those places usually resorted to, even including Madeira and Cairo. These two last-named places are unexceptionable as far as climate goes; but for many invalids the great distance from their own country, the long sea voyages,

and other objections, might put either of them out of the question. Whereas to either Valencia, Malaga, or Velez Malaga, no such objections can apply; and these are very easily accessible either by sea or land; taking the journey as described in the earlier chapters of these sketches, and proceeding on from Alicante to Velez Malaga by steam. There is neither fatigue nor inconvenience of any sort to be encountered. Not even an invalid, just recovering from illness, would find much difficulty in making the journey in that manner; indeed, it would be a most delightful trip in fine weather. There is, moreover, excellent accommodation at either of these places. Velez Malaga would have the advantage of being an equally desirable residence all the year round. Valencia might be too hot in the height of the summer season. There is no one charm to be desired to make daily life agreeable that these favoured spots do not possess; and the very brightness and gaiety that seems to pervade the atmosphere is most beneficial in cases of depressed spirits.

I must not pause on my journey, or I could tell of the Moorish remains at Ecija, its beautiful fountains and gardens, etc., or of another notorious haunt of bandits, "Les Niños de Ecija." Nothing can do away with the terrors still felt by muleteers, coachmen, and guides, as they approach the evil locality, though it is many years since any one was attacked there. Many weary miles have to be passed over endless plains, with nothing to interest the tired traveller in any way, and the dreary waste immediately preceding the approach to Cordova is perhaps the most monotonous and tedious of them all; so that we felt very much relieved when the palms and olives that encircle that town of many associations appeared in view. It is a picturesque city seen from a distance, almost like an oriental town; but, alas! it is better seen from the outside, as far as the present time is concerned; for within the change from its former glory is painfully apparent. Its fame as a renowned city is of very ancient date. Under whatever rule, this town seems always to have been celebrated for its learning, and the patronage it bestowed upon all those who were in any way distinguished for scientific or learned pursuits. Under the Gothic rule, as well as under the Moorish, Cordova was famed for piety as well as for learning, and many of the most celebrated Spanish authors were born within her walls. At one time so great was the celebrity of this city, that it was even compared to Damascus, and other great eastern towns. Indeed, it is like reading a wonderful romance, or one of the Arabian Nights, to peruse the account of Cordova under the rule of the Emir Al Mumemir; his own history is in itself as wild and romantic as any story that fiction could invent.

It is difficult to account for the total decay that seems to have fallen upon this once prosperous capital; its fate is more mournful even than that of other Spanish cities. It is now a melancholy sight—the long deserted gloomy streets, the half-ruined buildings, the uninhabited houses, and the utter absence of anything like movement in the place. After the brilliant and sunny scenes we had so lately left, the contrast was most striking. We visited the ancient mosque, once the third in importance in Mussulman estimation: it was supposed to be of equal sanctity with that at Jerusalem, and almost on an equality with Mecca. It was singular to stand within the altered walls (it is the present cathedral) and think of the thronging devotees that had formerly trod those floors, and prostrated themselves with all the signs of eastern humility within

the sacred edifice. It can boast of no exterior attraction, as it is surrounded by high thick walls; but the Court of Oranges, as it is called, gives one some idea of what the beauty of the entrance must have been in former days. Though now adapted to the Christian worship, it is thought to be a perfect specimen of the true Mohammedan temple, in its outer form and internal arrangements; beautiful marbles abound everywhere, priceless in value; but now even these seem to have lost their bright polish, and to partake of the gloomy character of all around, though much beautiful Moorish work still remains. It is a remarkable trait in these people, that with all their devoted admiration for beauty of all kinds, they were yet the most ruthless destroyers of the beautiful remains of antiquity. It is a well-known fact that they seldom would be at the pains of obtaining the materials for the works from the quarries, but they would seek some old Roman remains wherever they settled, generally fixing upon some spot where towns had formerly stood, and turning these to their own purposes, beautiful use they made of them; but still it is impossible not to regret their destruction of these remains of antiquity.

The walk round the walls was what pleased me the most in Cordova; there was a degree of melancholy attending the enjoyment, but not of a painful character, and I indulged in more than one lonely ramble round them, during the two days we spent at Cordova. The palm-trees were always a fresh source of pleasure to me, so great is my admiration of that beautiful tree. There is a touching legend told respecting the first tree of the kind planted at Cordova. The beautiful Eastern favourite of Abderahman, who followed her lord from Damascus to his western capital, was so miserable at the change, and especially lamented in such poetic terms the loss of the beautiful feathery palms of her native land, that her royal lover, willing to gratify her wish, caused some of these stately trees to be planted around her new home. Whether the remedy was efficacious in reconciling her to her European palace the legend does not relate. But there are the palms, flourishing as well as they do in their own country.

The decay of Cordova seems to make progress almost every day, and unless some sudden change occurs to restore some of its ancient prosperity, it will soon become really a deserted city. Beautiful filigree work is still executed there, and amongst the women one may meet with the most exquisite bits of old silver, with emeralds set in them. It is not easy to induce them to part with these: one is obliged to go very warily to work, so as not to let them perceive the value one places on the article, beyond its intrinsic worth; they are thoroughly eastern both in design and execution.

We were none of us sorry when we drove out of Cordova: the gloom and desolation began to affect us, and the sight of the beautiful Guadalquivir, with its noble bridge, and the rich fertile country on beyond, was certainly very agreeable. At Carpio, a small town on our road, we first perceived a change in the beautiful Andalusian dress, the women wearing green serge mantles of a peculiar shape, and handkerchiefs on their heads; and after leaving the miserable town of Bailen, famous only as having given the name to the battle of Bailen, where the Spaniards defeated the French forces under Marshal Dupont, the well-known Spanish brown cloaks and the corded sandals are frequently met with; for we were drawing near to La Mancha, and about to leave beautiful Andalusia. Oh, what a dreary change from everything most luxuriant and lovely in nature, to the arid, stony, desolate

country called by that well-known name! We entered the gorges of the mountains after passing Bailen, and once through these passes the change in the vegetation was most striking. But the mountain scenery is fine, rocks of most curious shapes overhang the road, and as the road enters one deep narrow gorge, called Despeñaperros, nothing can be more grand; it seems as if it was the portal of another world, so completely do these masses of rock separate the lovely province of Andalusia from La Mancha. How different must be the feelings of travellers, according as they are about to penetrate into that beautiful region, or, as was the case with ourselves, on the point of leaving all its many enjoyments behind! The contrast is so striking; you do not gradually exchange all the exquisite charm of tropical vegetation, of that blue sea, those romantic and picturesque Moorish towns and villages, for country less attractive, possibly, but still possessing its own charm, as so frequently occurs in other lands; but all at once, as an imaginative writer strongly expresses it, you pass from Eden, "a very Garden of Eden," into a comparative desert. Once through that magnificent gorge, and there is a great change.

But I must say a few words on La Mancha. The name of this province will recall to everyone that work of a world-wide celebrity, "Don Quixote, the Knight of La Mancha." When once one has travelled through this country, and seen how wholly it is without a feature to interest, the admiration felt for that wonderful author, Cervantes, increases tenfold as one reflects upon the charm he has contrived to throw around a scene so wanting in all charm. Its very name signifies "dry land." No trees, no verdure, no produce, but wide extended plains, or wastes rather, that look scorched up by the burning heat of the sun. And if we turn from the country to the towns we gain nothing, for they are miserably poor, and they look the very picture of monotonous desolation. It takes one a little time to believe that, in spite of appearances, these weary plains do in reality produce crops of grain, and that even vines grow there; still more strange, the wines made from the grapes are peculiarly rich in quality. Saffron is also largely cultivated on these plains. The inhabitants are in all respects superior to the region they dwell in; indeed, they have many really fine qualities that we should seek for in vain in the pleasure-loving Andalusians or Valencians. They are brave almost to rashness, singularly temperate, and capable of the firmest attachments to those that have in any way befriended them. They are perhaps more attached to their own families than any other of the Spanish peasants, and will work in the most untiring manner to support them. Had they been treated with anything like kindness by their superiors, instead of with the overbearing and harsh manner of a master to a slave, they might have made most attached dependants, whereas now, for the greater part, they shut themselves up in a reserved silence alike from their superiors and their equals.

The dress of the Manchegan peasant is unusually simple, composed of the universal brown cloth, with a singularly inconvenient cap. Strange that in this dreary region, where all seems alike sombre, that at the slightest hint of a merry-making all their stern gravity is laid aside, and not the gayest Majo and Maja can excel the Manchegans in the sprightliness of their songs, or the activity, lightness, and grace of their dances.

No sooner had we passed through the rocky portal I have described, than we found ourselves in the midst of all the scenery of Don Quixote. The Torre Nueva, the

Venta de Cardenas, and the Sierra, to the left of our road, were all scenes described in that famous book. Everything in Spain, the country, the inhabitants, the towns, all are so unaltered, that to read an account of a Spanish inn in the days of Cervantes is to read the exact account of one in these days. Of course I speak only of retired, out-of-the-way country inns.

The description of the Spanish hidalgo and his associates is so faithful, that one has not far to go to find originals for these characters. That strange mixture of qualities of profound gravity and sparkling humour is all described in these pages with such life-like truth and reality, that we might almost fancy as we read that the book was written in the present day. The attachment of Sancho to his master, his conviction of his superiority to all the rest of the world, is marvellously true to life. Even the devotion of the muleteers and guides to their masters, in cases where the connection between them has lasted for a considerable period, is proverbial. They will exalt the qualities of their lords for the time being, little caring whether the facts they relate are such as they state them to be, so long as they redound to the credit of their masters. They have the true feeling that should exist between a master and his dependant, that in exalting him they in fact exalt themselves; and many instances occurred during the Peninsular War where this almost chivalrous devotion was most admirably displayed in situations of peril and difficulty. It is impossible not to admire this part of the Spanish character. "Don Quixote" is really an invaluable book for the traveller in Spain. The love for short oracular sayings that is universal in Spain is clearly a remnant of the Oriental admixture which has left so many traces in the country and its inhabitants. All their opinions are delivered in this form; especially it is so amongst the lower and middle classes, and though at times it borders on the ridiculous to hear these scraps of philosophy brought in at every opportunity without much regard to their fitness, yet at the same time it imparts a certain dignity to their conversation, and gives scope for many witty sayings, and an opportunity for a display of that racy humour which so often distinguishes the Spaniards of the lower classes. But it is necessary to possess a very fair knowledge of their language before the traveller can really enter into or enjoy these peculiarities. So much has it ever been the custom of the people to resort to proverbs to explain or illustrate their meaning, that there are numerous curious collections of them that have been made at different periods.

But we were to see a scene still more connected with Don Quixote's history than any of those I have named. On the main road to Madrid that we were then travelling, there is a miserable little village named Puerto Lapiche. Near to this hamlet the road winds between two hills covered with olive-trees, and on these hills there are numerous mills for pressing out the oil, and also for grinding grain of different sorts. These mills are not very like ours, and they are considerably less in size. And as it was in this very district that the knight told Sancho they were to expect frequent adventures, it is not to be wondered at that he should have taken mills, precisely similar to the ones we saw, for gigantic individuals that he was bound to attack, especially as we must remember that at that time mills had not been long known in Spain.

The nearer we approached to the capital of Spain, the more completely uninviting does the country become. Nothing can go beyond the sameness of the colouring; and coming fresh as we did from all the brilliant hues of the south, it struck us all the more painfully. Not

even the brilliant September sun could brighten the scene. The women are strikingly plain, and wrapped up in their rusty brown cloaks their appearance is most unpleasing. There is one singularity attending the river Guadiana. It disappears entirely, and for a long time no one supposed that its waters ever came to light again; but later observations proved that it only runs underground for some leagues (about eight), and then again comes forth to the outer world; but unlike any other subterranean river (of which I have seen two, one in Syria and another in Derbyshire), it does not keep entirely out of sight. There are lakes along

palace. Ever since the reign of Ferdinand and Isabella it has been used as a summer residence by the reigning sovereign, and many of the Spanish songs speak in the most glowing terms of the delights of Aranjuez, its nightingales, trees, flowers and fountains. The palace, if so it must be called, has been added to by the different sovereigns, especially by the Bourbon kings, and there is a great amount of bad taste displayed in it; but after the arid dreary plains we had been traversing, the verdure in the valley of Aranjuez was most welcome to our eyes: The beautiful avenues of palm-trees, and the magnificent elm-trees, would bear comparison with the

PALACE OF ARANJUEZ.

its underground course which are known to be fed by its waters. They are chiefly remarkable for the fish which abound in them. The whole scenery of these lakes, and the singular cave of Montesinos, are admirably described in the pages of "Don Quixote."

Were it not for the interest thrown around a great part of the road to Madrid from its having been connected with many of the scenes of that clever and truthful book, the whole way from Cordova to Madrid would be monotonous and wearying in the extreme. At Villarta, our coachman told us we were entering the province of New Castile, which so closely resembles La Mancha, that there is scarcely anything to tell the traveller he has entered a new part of the country. What a remarkable thing it is, that stop where one will in Spain, at the poorest wayside inn or at a first-rate hotel, the bread surpasses any that can be eaten anywhere else in Europe! It is really delicious. Whether this excellence proceeds from the fineness of the flour or the skill of the making I cannot say. Enormous quantities of corn are grown in all this country, and the time of the harvest must bring some life and movement and cheerfulness into this ordinarily monotonous and melancholy region.

We certainly none of us regretted when our approach once more to a rocky pass through some most arid and gloomy-looking hills told us that we were approaching Aranjuez, where we were to spend a day.

Most people who have heard or read any accounts of Spain, either in the form of travels or history, will remember how famous this place has been as a royal

fine trees of our own wooded country; and though we came too late in the year to enjoy the singing of the nightingales, we were told by many of our friends that the accounts one has read of their numbers is by no means exaggerated, and that in the soft spring evenings nothing can be more ravishing or delightful than their song. Birds of many kinds frequent the royal gardens, where they are never interfered with, and very greatly they must add to the liveliness of the scene in the spring and early summer months. The royal residence is situated in a valley, well watered with streams and enjoying fresh healthful breezes, when the other parts of Castile are burnt up by the scorching heat and the want of water. Fountains abound in these gardens. We spent a long morning sauntering about the shady walks, or sitting down within hearing of the soft murmuring sound of falling water. The day was lovely, and the beauty of the foliage was great; here and there brilliant hues told of approaching autumn, while other trees still seemed decked in all their summer verdure. The palace was to me wholly uninteresting. As I contemplated the different rooms I thought of the beautiful Moorish palaces I had so lately seen, and felt more than ever how far better they understood the style of dwelling suited to the burning heat of the Spanish climate; and how little the Spaniards had profited by the beautiful models offered for their imitation. Those who care for such things may be interested in seeing the rare china and glass that has been collected by the royal inhabitants. The royal stables are very fine, and seem to be admirably managed. We saw some beautiful animals

there, and at the royal breeding establishments in the neighbourhood. I had not believed that even a Spanish mule could be such a beautiful creature as was one that I saw there. We were informed that the expense of keeping up these breeding stables is very great. There were a number of English horses, some that had only just arrived.

THE HAUNTS OF THE WILD DEER IN THE SOUTH.

THE march of civilisation, and the accompanying increase of the area of agriculture, have materially narrowed the range of wild animals, especially in southern Britain. In more rugged Scotland "the monarch of the glen" has still a wide range, and the huntsman and the deer-stalker may yet find scope for the real old-time chase;—very different from the artificial "sport" which is sought in letting a stag loose from a cart, and then running him down with trained dogs.

Although, however, the range of the wild deer is thus narrowed, it is not altogether obliterated. In one or more of the still uncultured and unenclosed tracts of the south, the herds of this noble animal still find a scant but sufficient pasturage, and their continued existence gives unwonted zest to the chase. In penning some descriptive details of one of these few remaining primitive districts of our railway-traversed land, we must not be understood as expressing an opinion for or against this kind of field sport. Our readers will form their own conclusions on the abstract question.

This wild deer land of the south lies on that shore of the Bristol Channel where Somerset and Devon meet, a bold and romantic line of coast in which the rugged and the soft alternate and mingle in rare succession and combination. The prospect of sea and land which may be gained from the summits of the noble headlands is truly magnificent, whilst the view of the interior hills from the coast is equally grand. Taking, for instance, his stand at Warren Point, which the reader will find on a good map, the spectator has in prospect a line of hill country some twenty miles in length—on the extreme left the towering Quantocks, and thence, stretching towards the right, the ranges of the Croydon and Grabhurst hills, which extend to the still bolder Dunkery, and the bleak heights of Exmoor. Such are the broad outlines of the landscape. The filling-in is rich with foliage and verdure; the well-timbered combes, the living green of the meadow land, the hanging woods of a deer park, and the brown gorse of the moorlands. Exmoor, at the extreme right of our *point de vue*, and indeed hidden from our supposed spectator at Warren Point by the North Hill, comprises upwards of 14,000 acres of forest and moorland, the surface undulating and rough in the extreme, the hill-sides producing little else than heather and ling. Few and far between are the habitations of man in this wild and barren tract, the aspect of which, when overhung with clouds, is dark and lonesome, suggesting the origin of a local name—the Blackdown Hills—a system which, according to Sir Henry De La Beche, forms "an elevated tableland cut into, more particularly on the west and south, by deep valleys, which thus divide it into several long lines chiefly running to the west, south-west, and south," and extending from near the northern to the southern coast of Devon—almost from the Bristol to the English Channel.*

* "Report on the Geology of Cornwall, Devon, and West Somerset," p. 3.

The deep gorges and glens of this country are locally called combes, the luxuriant timbering of which contrasts strikingly with the fern and gorse of the uplands. Especially is this so when, as is mostly the case, thecombe is the channel of a brooklet whose rapid waters, falling to the lower levels, seem to say:—

"Men may come and men may go,
But I go on for ever."

Among these choice spots is the hill-side of Cloutsham, one of the minor eminences of Dunkery, "rising," says a writer in the "Saturday Review," "from a waving sheet of woodland, a copse chiefly of oak and ash just swelling into a forest, and containing coverts which are the favourite haunts of the red deer." At the single farmhouse in this romantic spot Sir Thomas Dyke Acland, the hospitable lord of the manor, provides bread, cheese, and ale for the hunting parties at "the meet," often numbering 300, including not a few Dianas who share the general enthusiasm for the chase. Not, however, that all who come to "the meet" follow the hounds.

In immediate vicinity to Cloutsham is Horner Wood, a scene of the rarest sylvan beauty. Very many of the trees with ivy-covered trunks are exceedingly curious. Ferns and mosses are abundant. Along the bottom runs the "brawling stream" required to fill in the poetic picture:—

"In copsewood deep the glow-worm lights his spark,
The deer, half seen, are to the covert wending."

It was while wandering in the glades of Horner that we first encountered the hunt. The deep silence, varied only by the ripple of the waters, was suddenly broken in upon by a loud shout which caught up the eye to the brow of the overhanging hill. There we saw a single horseman, presently joined by another, whose red coat glowing in the sun bespoke him a huntsman. The two stood watching for some time; then the horn was vigorously blown, and anon thirty or forty more horsemen were on the spot, followed by the hounds, who streamed in eager procession down the precipitous sides, impracticable for horse or man. In another brief space a bevy of hunters, who had found a route to the bottom, poured into the wood in pursuit of the deer, which, for a moment, we saw, far in front of its pursuers, up the course of the stream. "Take the waters, take the waters!" was the shout which, from the huntsman at the top, rang loud through the valley, and speedily the dashing cavalcade vanished from sight, leaving us to our botanical researches in silence and seclusion.

The hunting season of 1867 was marked by several noteworthy incidents. Thus at a "meet" at Higher Combe, Dulverton, a fine stag was started which ran for many miles, right over the cultivated country, and at last found its way to Bickleigh, near Tiverton, where he ran into the river Exe, swimming majestically up the stream, but was, alas! captured. A farmer related to us the circumstances of a hunt in which the swift deer ran thirty-five miles in two hours twenty-seven minutes; 300 horsemen began the pursuit, but only thirteen were in at the close. The venerable pastor of one of these hill-side parishes told us that recently the hunted deer sought refuge in his vicarage meadow. The hounds and their masters ignored the right of sanctuary, and the stricken deer was caught where, if anywhere, peace and repose might reign. "Did you go out to see it?" was asked. "No," said the good man, "I could not bring my mind to witness the cruelty attaching to this sport." The excitement of the chase over the moors is enhanced by the perils of bog and precipice. "Mole's Chamber," for instance, is said to owe its name to the

swallowing up of a man in one of these bogs, and marvellous stories are told of hair-breadth escapes at precipices. Many of the local traditions relate to hunting. The instinct of the animal is said to be for making seaward, and only last year a fine stag ran to the very edge of a precipice overhanging the Bristol Channel, and falling over perished. Of olden times it is related that the deer has stood at bay near the head of Minehead Pier, scattering the few leading hounds with his antlers, and then, dashing out to sea, been captured by boatmen. Another tale depicts the inroad of a stag on a cottage standing with its back to the hill and face to the sea. The alarmed old woman of the house ran out at the front door, slamming it to, and so the deer was taken as in a snare. Such are the tales of the country side.

It is time, however, to pass from such anecdotes, and to resume our more immediate object, the description of the country. We wrote at the outset of that grand range of interior hills. This is not, like Scotland, "the land of the mountain and the flood," but it is "a land of brooks of water, of fountains, and depths that spring out of valleys and hills." The elevated ridge of which we speak is, in fact, the water-shed of two systems of rivers: those on the north—the Torridge, the Tor, and the Lyn—finding their way by short and rapid declivities to the Bristol Channel; while those on the south—the Exe, the Otter, and the Axe—pour their waters down a more gradual slope to the English Channel. Several of these principal rivers are swelled by tributaries which have also their source in these uplands.

During our visits we gained an insight into the little-explored phenomena of the river valleys. Starting, on one occasion, from Watersmeet, near Lynton, we walked for six hours along the course of the Lyn and the Brendon, the waters all the way tumbling, rushing, foaming over magnificent rocks:

"Here it comes sparkling,
And there it lies darkling;
Here smoking and frothing,
Its tumult and wrath in . . .
And so never ending, but always descending,
Sounds and motions for ever and ever are blending."

The entire fall of the waters must be several hundred feet. Ever and anon tributaries pour their treasures into the main rivers, and on and on they go, enriching the well-timbered banks, and fairly forbidding sleep to the artist or angler who may come that way. When, at the close of our six hours' walk, we were compelled to strike for the upland moors, we saw the silver line of the waters still stretching far beyond into the valley. Again, we walked for five-and-twenty miles down the valley of the Exe. Having crossed the hills at one of their loftiest points (Outcombe), we came upon the river at Eyeson Hill, from whose sides iron ore is taken, reminding one of that promised "land whose stones are iron, and out of whose hills thou mayest dig brass." To our first sight the Exe was but a little rivulet; ere the close of that walk we saw it a fine broad river. All along its meandering course the water is beautifully clear, running a rapid career in a perpetual succession of cascades. Throughout this prolonged but circuitous glen, hollowed out of the table-land already described, the sides are gorgeously timbered. It being the autumn season, the varied tints were beautiful. Every now and then other glens or combes opened up right and left, presenting landscape groupings sometimes of great extent, at others more limited. Then again the rocks overgrown with mosses often crop out, and the whole

forms a succession of scenes which pen or pencil must alike fail to depict. The signs of population are few and far between. A writer, already quoted, observes that it is "not uncommon for a farm-house, in the region of the upper waters, to find its nearest neighbour at from three to five miles off. There is little arable cultivation in these wild uplands, and the flocks and herds which form the farmers' chief wealth have a wide range of pasture." There are hardly any villages or churches, and as to churches, there seems to have been a strange fancy for perching them on the hill-tops.

The first village of any size on our route was Bridgetown. We remarked to one of the villagers, "A beautiful place this." "Well, I dun know, yaas, a comfortable village!" was the man's unconcerned reply. So true is it, that the mind must be educated to see beauty even where it is thus divinely stamped on the very face of nature. At Chilly Bridge we made a *detour* of two miles to Dulverton, a little town nestled amidst an amphitheatre of wooded hills. Here we struck upon the Barle, twin stream with the Exe, which it joins at Exebridge. From the junction of the waters we pursued our way along the now united and augmented river as far as Tiverton, the boundary of a long day's excursion, and on the following Sabbath a "quiet resting place."

We have spoken of the glorious land scenery along these river banks. Let us observe, that the waters are also rich in their peculiar treasures. "The river Exe is," says Mr. Frank Buckland, "naturally a salmon river." Passing over his remarks on its lower course, we further read that, "From Tiverton upwards I hear no river keepers or anglers have ever seen an adult, but they do see smolts or gravelings descending in large numbers—not many in 1866, but in 1865 a large number. From Tiverton up as far as the junction of the Barle there are alternations of deep pools and magnificent spawning grounds, but no one has ever seen a salmon making its nest in this district. As the young are seen to descend, I have taken great pains to ascertain where they could have been born. They do not spawn in the small streams on Exmoor, but all the evidence goes to prove that this operation is carried on in the streams above Dulverton, where they are protected from their enemies at this dangerous period of their existence by brushwood, which forms pleasant covers, and which come down close upon the water's edge. The river Exe appears to be the largest and most promising river in the West of England."

Our return journey was up instead of down the Exe valley, and with a varied route which included a sight of the river-side ruins of Barlinch Abbey. According to Tanner, William De Lay, in the time of Henry II, founded here a priory of Black Canons. It had about the time of the dissolution eight canons, who were endowed with £98 18s. 4d. per annum. The house was granted by Henry VIII to Sir John Wallop. The extensive ruins are now occupied as farm premises. As to the landscape on our return route, description would be but a repetition of what is already written. Suffice it to say that, as the shades of evening closed in, we had again reached the summit of the lofty ridge of hills. Here all at once we sighted the sea:—

"When sudden, as I turned my way,
Burst in the ocean-waves;
And lo! a blue wild-dancing bay,
Fantastic rocks and caves!"

The twilight had become darkness ere our long but pleasant walk was ended. Does the reader ask how he may visit this land? Minehead, Dunster, or Porlock, within easy reach of the Williton station, may be adopted

as places of sojourn whence the desired excursions can be made. The most central spot is Porlock, celebrated by Southey, during his detention at the village inn:—

"Porlock, thy verdant vale, so fair to sight,
Thy lofty hills, which fern and furze embrown,
Thy waters, that roll musically down
Thy woody glens—the traveller with delight
Recalls to memory."

JOSEPH GLASS,

THE CLIMBING-BOYS' ADVOCATE.

It is commonly supposed that the race of little chimney-climbers has happily disappeared from the face of the country. It takes something like a long memory to recollect those "innocent blacknesses," as Charles Lamb called them. Swart servants of a dark age, they used to toddle about after their masters with soot-bag and shovel: nothing white or natural about them from head to foot but their shining eyes and glittering teeth. When the flue of *Materfamilias* smoked, or the parish engines had been in requisition for a fire in her chimney, a proprietor of these poor little slaves was sent for. He came like a ratcatcher with his ferret—had a look at the "chimbley," as if it were a rabbit hole—spread his dirty sacks and clouts to catch the soot—and then he popped the wretched climbing-boy in. There was a scuffle and a struggling as the small thing worked its painful way up in the filthy reek; presently you heard a clattering of shovel and broom, and the soot came down in black avalanches; then the master of this grimy ferret used to go out to see that the lad went right up and put his hapless head or hand and brush out at the very top. When he did not roll

down neck and crop, the little wretch emerged choked and covered with the soot, all except the irrepressible child-eyes and hungry child-teeth. Sometimes he stuck fast and could not be got at, and sometimes he came down the wrong shaft over a fire and was asphyxiated; his miserable knees always used to get scratched and torn, and sooner or later he was pretty sure to have "sweep's lungs," or "sweep's cancer." It was a cruel and wicked practice, and most shocking is the reflection that it existed so long. But at last the law did sweep the little sweeps away; the "machine" was invented, which does the business perfectly; and this breed of tiny Africans won their emancipation.

But a horrible story, told this summer in the Maidstone Assize Court, revealed the fact that climbing-boys are still employed in some parts of the country. The report of that case elicited from a morning newspaper an indignant article, from which our opening paragraph is extracted. It is to be hoped that such cruelties now rarely occur; and that they are now exceptional is due to many benevolent persons, and especially to one, whose labours in this good cause deserve perpetual record.

In the year 1823, among the workmen then employed in building Finsbury Circus, London, was one whose industrious habits, quiet manners, and neat personal appearance, singled him out from amongst his fellows. He never kept Saint Monday. When the day's work was done he went home, donned his working clothes for cleaner attire, and spent the evening with his wife. His home and his wife were a picture of comfort. There was only one room: the furniture was simple but all new and neat, and there was a handsome Kidderminster carpet, a luxury just beginning to be introduced into the houses of the poorer classes of the community. His domestic happiness is best described in his own words. "An arrangement was entered into between my wife and myself that each should do the best we could to please each other. By this means everything passed on most delightfully. On going home to my meals I found everything in the nicest order. At breakfast-time the fire was bright, the toast was made and ready cut, and by the time I could sit down the coffee was poured out. At dinner-time I had not to wait a minute, all was ready; and at night, when my work was done, I leisurely enjoyed my tea. This done, we entered upon a retrospect of the past and expressed our anticipations of the future. Our position was to both of us the commencement of happy days: year after year passed away and there was no abatement in our domestic felicity."

Joseph Glass, whom we thus present to the reader, spent the early part of his life at Manningtree, in Essex, and from his boyhood was remarkable for his intelligence and retiring habits. Another characteristic was that of self-control, evidenced by two circumstances which occurred before he was twenty years of age. At a village feast he had been induced to drink to excess, and was carried home helpless. Feeling the disgrace acutely, he formed a determination never to drink again. This was long before Temperance or Total Abstinence Societies were heard of. He kept his resolve throughout his life, and remained an earnest "teetotaler" to his dying day. At another time he gave way to violent passion. Upon after reflection he felt mortified and humbled by its unreasonableness and sinfulness, and made a vow never to give way to passion again. He wrote his vow upon a piece of paper, and kept it in his waistcoat-pocket. Whenever he found his passion

rising, he felt for the paper, and thus learned to rule his own spirit in spite of his naturally hasty temperament.

He was celebrated among his village neighbours for his rhymes. Some of his papers on "Contentment," "Retirement," and "The True Gentleman," after the lapse of nearly half a century, are still decorating the walls of the cottages in the neighbourhood in which he lived.

The father of Joseph Glass, a stonemason of Colchester, a man of extreme political opinions, who had been nearly pelted to death for refusing to take off his hat to King George III, went to Pennsylvania, leaving his son in the care of his deceased wife's brother, who was a builder in Manningtree. There he learned his uncle's trade, and became early schooled in trouble. The sober, quiet habits of the nephew were not appreciated by his relative, and before his apprenticeship was completed he had to shift for himself. "I hired a large old-fashioned room," he afterwards wrote, "at one shilling per week. On evenings after work I decorated the fire-place with Scripture Dutch tiles, and adorned the walls in water-colours with country scenes, churches, farm-houses, and cottages." Three years he dwelt in his painted chamber, and then he went on his travels, working for some time not far from Beverley, in Yorkshire. He was about thirty years of age when he came to London, and married his wife, Mary Hutchinson, to whom he had been attached before he left his home in Essex.

A year or two of happiness had scarcely elapsed, when he was unexpectedly applied to by the Society for the Suppression of Climbing-Boys, and a new current was given to his life. The cruelty of the practice of employing young children in sweeping chimneys was beginning to be recognised. Jonas Hanway, in the preceding century, had done much to alleviate the sufferings of these friendless children. Not long before the time we are writing of, James Montgomery published a book advocating the claims of climbing-boys to the sympathies of the public. Charles Lamb wrote a genial article about the poor boys in his *Essays of Elia*. The extent of the evil was indeed very great. Hundreds of children perished miserably in their perilous work. Boys, and even girls, at the age of six years and upwards, were *bought* by the chimney-sweepers and trained to ascend the foulest of flues. Imagine a poor child with a black cap drawn over his head and face, ascending, by dint of alternate pressure of knees and back, perpendicular heights of forty, sixty, and sometimes eighty feet, and some idea may be formed of the fearful nature of the employment. The knees became excoriated and ulcerated in all cases before the skin of these little sufferers became inured to their daily work. Sometimes by drawing their knees up too tightly in ascending the flues the children became wedged in, incapable of moving one way or other. Grappling irons had to be used from above, or ropes fastened to the feet below, in order to extricate them from their positions. Who can describe the exquisite torture thus produced? It would be useless to detail the numberless instances of children roasted, smothered, and crushed to death, or lingering in painful disease, as the result of their disgusting employment.

It was strange that the system ever found defenders at all. Southey, writing in "The Doctor," about 1814, gives an account of one of the opponents of emancipation. "The bill which should have put an end to the inhuman practice of employing children to sweep chimneys, was thrown out on the third reading in the House of Lords (having passed the Commons without a

dissentient voice), by a speech from Lord Lauderdale, the force of which consisted in, literally, a Joe Miller jest. He related that an Irishman used to sweep his chimney by letting a rope down which was fastened round the leg of a goose; upon which he replied that a couple of ducks might do as well. The Lords laughed; his lordship had the satisfaction of throwing out the bill, and the home negro trade has continued from that time, now seven years, till this day, and still continues. His lordship had his jest, and it is speaking within compass to say that, in the course of those seven years, two thousand children have been *sacrificed* in consequence."

There was, nevertheless, an insuperable difficulty in the way of passing a bill. No effectual means had been contrived to *supersede* the use of the climbing-boy. Men of eminence in engineering science had been consulted, and had failed to suggest anything that would do the work of the children. The climbing-boy appeared to be indispensable, a kind of necessary evil, to be mitigated, but not prevented, by the humane.

The society for the suppression of the traffic had, however, applied to the right man when they asked the hitherto quiet and contented workman to try his hand. He was fired with the idea. Here was a work in which he might become a public benefactor, and thousands of children look upon him as their friend and saviour from a miserable and soul-killing occupation. But the new undertaking was far from being "respectable." How would his affectionate wife, a "pattern of neatness and good taste," as she was styled, bear the contact with soot and dirt. It was no dilettante interest that had to be taken in the experiment; but stern, hard, ill-remunerated work, to discover by actual practice how chimneys could be swept without the aid of children. His friends unanimously advised him not to enter upon such a precarious enterprise. Self-reliant and hopeful, and following the dictates of his heart, he finally decided to undertake the work; and was soon taxing all his energies and inventive powers to discover a method of sweeping chimneys mechanically. One difficulty after another was surmounted, and in 1827 he produced the *chimney-sweeping machine*, still in universal use throughout the United Kingdom. The bundle of jointed rods, surmounted by the large stiff circular whalebone brush, must be familiar to all who have seen the sooty chimney-sweeper on his daily round.

It was no easy matter to introduce the machine to the public. The chimney-sweepers were violently opposed to the use of it, and strove by every means in their power to prevent its adoption. The trade had become an important one, for statistics showed that nearly one thousand boys were employed in sweeping chimneys in London alone. After seven years' labour, Mr. Glass succeeded in bringing the machine into such general use in the metropolis, that he was able to give a list of more than one hundred public buildings in London swept by the machine, when called upon to give evidence before a committee of the House of Lords in 1834, to whom was referred another bill for the prohibition of the use of climbing-boys. Unfortunately the opposition was not confined to the chimney-sweepers, for representatives of insurance companies, architects, builders, and others, gave evidence against the bill in committee: and the bill was thrown out.

In conjunction with the Society for the Suppression of Climbing-Boys, Mr. Glass held meetings, not only of the public, but also of the chimney-sweepers themselves. The writer well remembers an assemblage of some hundreds of chimney-sweepers, held in a large school-

room in Milton Street, Cripplegate, of the most uproarious character. When Mr. Glass attempted to explain the machine, and recommend its use, on the grounds that it was more effective than the use of boys, and that it would prevent an incalculable amount of human suffering, the yelling and shouting were fearful. It needed a considerable amount of moral courage in Mr. Glass and the gentlemen who accompanied him, to enable them to face the riotous audience.* In spite of opposition the philanthropists laboured on; and great was the triumph when at last they found that the public recognised their efforts, and an eloquent leader in the "Times" heralded the way to the introduction of a fresh bill into Parliament. Before a select committee of the House of Lords the battle was waged. It is surprising to read in the present day that the managing director of one of the largest insurance companies objected to the discontinuance of the use of boys because they were in the habit of sending up the poor children, after a chimney had been on fire, to see if the fire was out! How would they know that a fire was out unless they sent somebody up the chimney to see! But the evidence of the effectiveness of the machine, and the cruelty of the practice of employing boys, was overwhelming. The bill was recommended by the committee, passed both Houses, and became what is now called the Act of 1840, for the Regulation of Chimneys and Chimney-Sweepers, any one employing boys being liable to a penalty of five pounds for the first offence, and ten pounds for the second.

During the two years before the Act came into operation, Mr. Glass travelled all over England, holding meetings, explaining the provisions of the Act, showing the practicability of the machine, and taking steps for the discontinuance of the use of boys. The labour was enormous. Nearly every large town in England was visited, and many of the country residences of the nobility were examined, and the chimneys altered to enable them to be swept by machinery. So thoroughly was the work done, that when the Act came into force, in 1842, the adoption of the machine was complete in the metropolis, and general throughout the country. Prejudices were, however, still very strong in many places, and occasional journeys had to be made in the interests of the climbing-boys.

Mr. Glass was actively employed in other works of usefulness. Identifying himself with the temperance movement, he was one of its foremost supporters. His house was open and a welcome always ready for the reclaimed men who were afterwards its most eloquent advocates. Amongst those who thus partook of his hospitality was John Cassell, who came up to London from his carpenter's bench to lay, in the adoption and advocacy of temperance principles, the foundation of his remarkable success. Mr. Glass was for some time chairman of the Parent Committee of the British and Foreign Temperance Society. He wrote "The Experiences of a Journeyman Bricklayer," a temperance paper of so much practical good sense and freedom from verbiage, that it became the most popular and widely distributed tract of the day.

* Mr. Hone, in his "Every-day Book," describes an invention of Mr. George Smart, called a "Scandiscope," for which two gold medals were given by the Society of Arts. It appears to have been one of the earliest machines which excited the opposition of the master chimney-sweepers. The same book contains an account of a meeting in St. John's Wood, on the 1st of May, 1826, where one master sweeper affirmed with great vehemence, and amidst general enthusiasm, that it was "a thing impossible" to do away with climbing-boys. "For instance, look at the Duke of York's fifty-one new chimneys. Let me ask any one of you in company, is it possible a machine could be poked up any one of them?"

He was singularly unsectarian. Originally belonging to the Wesleyan Methodists, without discontinuing his connection with them, he for some years regularly attended his district church, and was as ready to support the Sunday schools and other religious undertakings of the one as the other. Latterly he attended the ministry at Stockwell Chapel, evidencing the same catholicity that had distinguished him in earlier life.

In his later years Mr. Glass gradually retired from all active engagements. His memory going back to the scenes of his boyhood, he employed some of his leisure hours in writing a "History of Manningtree" in rhyme. But his heart was still in his old work. Finding that the boys were clandestinely used for sweeping chimneys in many of the provincial towns, he published a little monthly periodical called "The Climbing-Boys' Advocate," and succeeded in arousing the attention of the humane in Derby, Leicester, and other places.

Mr. Glass never patented his useful invention. He received the silver medal from the Society for the Suppression of Climbing-Boys, and £200 left by a benevolent lady as a prize to the inventor of an effective machine for sweeping chimneys. Modest and unobtrusive, he rarely mentioned his own name in connection with the Climbing-Boy Emancipation. In the "Advocate" he signs himself "The Editor," and with the exception of occasional references to Glass's Machine, the uninformed reader would learn nothing concerning this earnest and self-denying philanthropist.

Full of years, without a care, having accomplished the object of his life's work, Joseph Glass passed away to his rest. The last time he took up his pen he wrote to one of his sons:—"I have lived a lengthened period, and have seen better days than my ancestors. My long life after all seems but short, only I have the consolation of knowing that my last days are my best. Sometimes I think the winter or the summer as it comes round will be my last. But I do not think so despairingly. I have faith in the future, and trust in the only sure foundation." Three weeks after the above was written death came as a welcome messenger. He died on the 29th December, 1867, in his seventy-sixth year.

A PARISIAN MUSHROOM CAVE.

It is pretty generally known that mushrooms are grown in great quantity under Paris and its environs, but it is somewhat difficult to obtain access to these *carrières*, and therefore a few words descriptive of one of them may not be unacceptable. The locality is that of Montrouge, just outside Paris. The surface of ground is cropped with wheat; here and there are heaps of white large cut stones ready to be transported to the buildings of Paris, and which have recently been brought to the surface through the coal-pit like openings. There is nothing like a "quarry," as we understand it, to be seen about, but the stone is extracted as we extract coal, and with no interference whatever with the surface of the ground. We find a "champignoniste" after some trouble, and he accompanies us across some fields to the mouth of his subterranean garden, if we may so call it. It is a circular opening, half of it being covered with planks, and the head of a pole with sticks thrust through it appears a couple of feet above the surface, its base resting in the darkness seventy feet below. We descend by this shaky pole with the sticks thrust through it, and soon reach the bottom of the shaft, from which little passages radiate. A few small lamps fixed at the ends of pointed

sticks are placed below, and with one of these we follow our guide. Our passage is narrow, but roomy enough to stand erect, and immediately on entering it mushroom culture begins. On each side of the pathway there is a small bed of moist half-decomposed stable manure, not covered with earth—they are beds which have been made quite recently, and have not yet been spawned. Presently we arrive at beds in which the spawn has been placed, and is "taking" freely. The spawn in this cave is introduced to the little beds by means of flakes taken from an old bed, or, still better, from a heap of stable manure in which it occurs "naturally." Such spawn our guide preferred, and called it virgin spawn, and considered it many times more valuable than that taken from old beds. Of spawn in bricks, as in England, there is none.

Our championniste pointed with pride to the way in which the flakes of spawn had begun to spread their influence through the little beds, and passed on, sometimes stooping very low, and cautioning us against the pointed stones in the roof, to where the beds were in a more advanced state. Here we saw, and with much pleasure, little, smooth, pretty-coloured ridges running against all the sides of the passages, and wherever the rocky subway became as wide as a small bedroom, two or three beds were placed parallel to each other. These beds were young, and dotted over on their sides with mushrooms no bigger than sweet pea seeds, but regularly dotted thus, and affording an excellent prospect of a crop. Be it observed that the little beds contain a much smaller body of stuff than is ever the case in our gardens—twenty inches high, and about the same width at base, being about the maximum, and of course these against the sides of the passages have not so much matter as those shaped like little potato pits, and placed in the more open spaces. The soil with which they are covered to the depth of about an inch is nearly white—it is simply sifted from the rubbish of the stone cutting above, and the use of this gives the recently made bed the appearance of being covered with whitish putty. Although we are from seventy to eighty feet below the surface of the ground everything looks very neat, in fact very much more so than could have been expected, not a particle of litter or matter out of place being met with the whole time. Some length of bed is made every day in the year, and as they naturally finish one gallery or series of galleries at a time, the beds in each have a like character. As we proceed to these in full bearing, creeping up and down narrow passages, winding always between the two little narrow beds that line the passages, and seeing now and then wider nooks at the side filled with two or three little beds, even if the space be but a few feet long, daylight is again seen, this time coming through another well-like shaft, formerly used for getting up the stone, but now for throwing the requisite materials into the cave. At the bottom lies a large heap of white earth before alluded to, and a barrel of water—for gentle waterings are required in the quiet, cool, mighty stillness of these caves, as well as in the mushroom-houses on the upper crust.

Again we plunge into a passage dark as ink, and are between two lines of little beds in full bearing, the beautiful white button-like mushrooms appearing everywhere in profusion along the sides of the diminutive beds, something like the drills which farmers make for green crops. As the proprietor goes along he removes sundry bunches that are in perfection, and leaves them on the spot, so that they may be gathered with the collection for to-morrow's market. He gathers largely every day,

occasionally sending more than 400 lb. weight per day, the average being about 300 lb. A moment more and we are in an open space, a sort of chamber, say 20 feet by 12, and here the little beds are arranged in parallel lines, a passage of not more than four inches separating them, and the sides of the beds literally blistered over with mushrooms. There is one exception; on half of the bed and for about ten feet long the little mushrooms have appeared and are appearing, but they never get so large as the pea stage, and then shrivel away, "bewitched" as it were. At least such was the inference to be drawn from the cultivator's expressions about it. Generally the mushrooms grow in bunches, and so equally-sized that it is often desirable to gather the whole crop at the same time.

The sides of one bed here had been almost stripped by the taking away of such bunches, and it is worthy of note that they are not only taken out, root and all, when being gathered, but the very spot in which they grew is scraped out a little, so as to get rid of every trace of the old bunch, and then the space is covered with a little earth from the bottom of the heap. It is the habit to do this in every case, and when our guide leaves a small hole from which he has pulled even a solitary mushroom, he fills it with some of the white earth from the base, no doubt intending to gather other mushrooms from the same spots ere many weeks pass. The mushrooms look very white and pretty, and are apparently of prime quality. The absence of all litter coverings, dust, etc., and the daily gatherings, secure them in what we may term perfect condition. I visited this cave on the 6th day of July, and doubt very much if at that season a more remarkable crop of mushrooms could be anywhere found than was here presented in this subterranean chamber—a mere speck in the space devoted to mushroom culture even by one individual. When I state that he has 10,000 *metres* (yards) run of mushroom beds in the ramifications of this cave, and yet it is but one of a large number, our readers will have some opportunity of judging of the extent to which mushroom culture is carried out near Paris, not only for its own vast wants in this way, but also for other countries, for they are successfully preserved and sent in quantity to England and other countries. There were some traces of the teeth of rats on the mushrooms, and it need not be said these enemies are not agreeable in such a place, but they did not seem to have committed any serious ravages, and are probably only casual visitors, who take the first opportunity of obtaining more varied food than is afforded them by these caves. We again find our way to the bottom of the shaft, mount one by one carefully up the rather shaky pole, and again stand in the hot sun in the midst of the ripe wheat. In traversing the fields, two things relating to mushroom culture are observed—heaps of white gritty earth, sifted from the *debris* of the white stone, and large heaps of stable manure accumulated for mushroom growing, and undergoing preparation for it. That preparation is different from what we are accustomed to give it. It is ordinary stable manure, not droppings, or very short stuff, and it is thrown in heaps four or five feet high, and perhaps thirty feet wide. The men were employed turning this over, the mass being stamped down with their feet, and a water-cart and pots lying beside to thoroughly water it where dry. The mushrooms grown by the market gardeners in their gardens in winter are considered to possess the finest flavour, but mushrooms may be and are cultivated in the equable temperature of the caves with success.—*The Gardeners' Chronicle*.

Varieties.

SOLAR ECLIPSE OF AUGUST.—At the Norwich meeting of the British Association much interest was excited by the following telegram despatched from India two days previously: "August 21, 1868—Eclipse. Observed protuberances. Spectrum very remarkable and unexpected. Protuberances of a gaseous nature." This was addressed to Admiral Manners, President of the Royal Astronomical Society, by Dr. Janssen, head of the expedition sent from Paris. A telegram was also received from the English expedition, announcing that the observations in India had been successful. In our August astronomical paper will be found a notice of this expedition, and of the objects to be specially observed, a full report of which will in due course be given. The determination of the nature of the red protuberances on the sun's disk when eclipsed was made by the spectrum analysis, which is revealing so many physical secrets of the remote heavens.

PETROLEUM.—Professor Hitchcock, of New York, states that petroleum is unquestionably of organic origin. In his opinion the great mass of it has been derived from plants; it has been thought by some to be derived from the animal kingdom, being either a fish oil or a substance related to adipocere. It does not appear to be the result of a natural distillation of coal, since its chemical composition is different from the oil manufactured from the cannels, containing neither aniline nor nitrobenzole. Moreover, petroleum occupied fissures in the Silurian and Devonian strata of America long before the trees of the coal period were growing in their native forests. Brine is generally associated with petroleum, and the fact of the slight solubility of hydrocarbon in fresh water, but insolubility in salt water, excites the inquiry whether salt water of primeval lagoons may not have prevented the escape of the vegetable gases beneath and condensed them into liquid. The immense territory in North America, several hundred square miles in extent, underlaid by certain geological formations in an unaltered state, implies that the petroleum of the New World, like its coal, is probably inexhaustible. In a paper by Professor Hitchcock, read before the British Association in 1866, he states that in five years the United States of America produced more than 300,000,000 gallons of petroleum. The average daily yield in the year 1866 was at least 12,000 barrels. The business of collecting, transporting, and refining it employed as many hands as either the coal or iron trade. The most prolific of all the petroleum regions is Western Pennsylvania. The oil is found beneath each of three sandstones or sets of impervious strata. Petroleum may occur in cavities and fissures in the strata. The existence of a cavity is inferred from the prodigious amount of fluid spouting out of the ground; at the Grant well at Pitt Hole the produce was at the rate of 1,800 barrels of petroleum per day. There are no less than fourteen different formations in North America from which petroleum has been obtained.

COURTS OF CONCILIATION AND ARBITRATION.—The manufacturers and operatives of the Staffordshire Potteries have formed a Court of Conciliation and Arbitration for the settlement of disputes in the pottery trade, consisting of ten employers and ten workmen. Courts of Conciliation existed in ancient Greece and Rome, and have been in operation since 1803 in France, where there were eighty Boards of Conciliation and Arbitration. In the last few years no less than 174,487 trade disputes have been settled by the lesser court, which consisted of four members, leaving nearly 10,000 for the decision of the larger, or arbitration board; but when it was found that these 10,000 cases could not be settled by the Court of Conciliation, 4,589 were withdrawn, and only 5,178 went before the higher tribunal. These courts worked well in Belgium, but have been most successful in Denmark and Norway, where the principle has been applied not only to trade purposes, but to a settlement of differences in private life. Three years before the establishment of these courts there were 25,000 cases for the lawyers, but in the year following their formation there were but 9,000. The time has come for legislation on this question in England.

TROUVILLE.—Trouville has become the fashionable sea-bathing place. It has beaten Dieppe, Havre, Etretat, and Villier, and rivals Biarritz. I ought to be proud of this success, for the town is my America, and I have this in common with Columbus, that I have not given my name to my discovery. That event happened in 1831. The place was then at the end of the world; three days were required to reach it;

and it was the *Stetinus hic tandem* of the Parisian tourist. One day a commercial traveller appeared there, another day an artist. Neither history nor legend has preserved the name of the former, and the remembrance of the latter is only due to its owner's celebrity. He was the idealist Paul Huet, who contends in every exhibition with the realist Courbet. I was the third voyager who approached the locality. From the Trouville which I found in 1831 to that of to-day there is the difference between the Otaheite of Bougainville and that of Dupetit-Thouars. When I first went there, the village contained fifteen or twenty fishermen's huts, a dozen thatched cottages, a population of 150 souls, and a single inn, the Auberge de la Plage. At present there are 1,000 houses, 5,000 inhabitants at ordinary times, and 15,000 during the bathing season, with twenty-five hotels; some of them palaces. In 1831 people walked about in shirt-sleeves or blouses, sometimes even still less clad. At this moment the rule is to dress three times a day, and occasionally the actors of the Comédie-Française come and perform there. In addition, there are races, concerts, promenades, picnics, balls, magnificent toilettes; in fact, all the usual amusements of the seaside.—*Alexander Dumas, senior.*

THE CAUCASUS.—Three members of the Alpine Club, Messrs. Freshfield, Moore, and Tucker, with a Chamonix guide and two Urspich porters, this summer ascended to the summit of Kazbek (16,546 feet), and of Elbrouz (18,526 feet). These mountains lying considerably to the north of the main chain of the Caucasus are within the limit of Europe, and therefore, as the explorers remark, "the claim so long made for Mont Blanc to supremacy among European mountains is quite unfounded."

ICE.—Mr. Lousada, her Majesty's Consul at Boston, in his report on the trade and commerce of Massachusetts, states that, even in America, although this important article of export is mostly called "Wenham Lake," yet, in reality, only a very moderate quantity is cut on that pond. He reports that ice is so much an article of necessity with all Americans that nothing surprises and annoys them more on their travels than the parsimonious use of it in Europe. They have frequently told Mr. Lousada that the first ring of it against the tumbler on their return to America had a most pleasant and home-like greeting. The export of ice from Boston is steadily increasing. In 1863, 71,245 tons were exported, and in 1864, 104,356 tons were shipped to the following countries:—Calcutta, 7,472 tons; Hongkong, 2,381 tons; Bombay, 3,255 tons; Madras, 1,508 tons; Cape of Good Hope, 300 tons; Mauritius, 1,350 tons; Kingston, Jamaica, 2,232 tons; Barbadoes, 1,309 tons; Havannah, 8,181 tons; St. Thomas, 1,282 tons; all other ports, 75,137 tons. In 1866, 124,751 tons were exported. The crop of 1867-8 was the finest ever known, of at least twenty-two inches thick, and of crystal purity; only 88,496 tons of it were exported. Most of the block ice used in England is imported from Norway.

PAUPERISM IN ENGLAND.—The expenditure in relief has increased from £6,317,255 in 1834 to £6,959,840 in 1867; and the management charges alone have increased from £596,162 in 1853 to £696,098 in 1863, and £730,704 in 1867. No doubt these figures ought to be carefully watched; but they prove that pauperism has greatly diminished in comparison with the growth of population and wealth. During the larger period, of thirty years, the population of England and Wales has increased from 14,322,000 to 21,100,000; that is, we have become nearly half as many again. Had we now the same proportion of pauperism as in 1834, it would be costing nearly ten millions sterling; nay, a good deal more, for wages are much higher than they were thirty years ago. It is necessary to pay more in order to obtain efficient officers, and the scale of indoor as well as outdoor relief is much more liberal, and therefore more costly, than when the law first started, bare, hard, and cold, from the brain of political economy.

INDIAN RAILWAYS.—From the report of Mr. Juland Danvers, the Government Director of the Indian Railway Companies, it appears that there are now 3,943 miles of railway open in India. "Ten years ago it took about three months to convey a regiment from Calcutta to Simla; now it occupies five or six days. Then, about 300 miles of railway were open throughout all India, and about 2,000,000 of people travelled on them; now there are nearly 4,000 miles, traversed by 13,746,300. The capital expended ten years ago amounted to about £20,000,000; now it amounts to upwards of £75,000,000."

THE LEISURE HOUR.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper.*

ON THE WAY TO THE CASTLE.

THE EXILES OF SALZBURG.

CHAPTER V.

FOR many weeks Manlicken was confined to his bed, gradually though slowly recovering from the serious injuries which he had sustained. In order to relieve his active mind from the weariness which oppressed it, Barbara frequently read to him out of Hans Weinsleider's Bible. Thus it happened that the father's eyes were frequently fixed upon the reader's countenance. It forcibly occurred to him, at last, that in all probability he himself had occasioned the wan and

pallid appearance of his child, formerly so blooming. Frequently he would seize her hand and press it long and fervently; as frequently Barbara experienced pangs, not less acute from her disappointed love for Hans than from the consciousness that she had erred against her parent, for she had felt happy in the evil surmise and naughty hope, against which she had nevertheless struggled with all her power, that in consequence of her father's misfortune the detested marriage would be necessarily deferred. Nay, she had even permitted a gentle whisper from the inmost recesses of her heart to steal upon her, that by the death of her father, for

whom she felt, nevertheless, great affection, she would be freed from a suitor whom she found it impossible to love. To atone for this evil thought she directed all her care and tenderness to the sufferer, to whom her assiduity appeared to restore composure. And thus it also happened that Catherine, the faithful and loving wife and mother, felt her affection deepen still more when she perceived the bonds of cordial love more intimately uniting the parent and child. This soothing peace augmented Manlicken's contentment. At times he would anxiously inquire after his domestic affairs, and the progress of the farm, when from the mother's lips, eloquent in praise, he would learn how skilfully and industriously Hans attended to the business, occupying himself from an early hour in the morning until late at night, so that the neighbours could not sufficiently admire the ability and experience of so young a man. On such occasions a mild beam of satisfaction illumined Manlicken's countenance; but still brighter was the ray which shone from the eyes of the delighted daughter.

Peter, the intended bridegroom, alone disturbed the tranquillity of the united family. At first he was certainly moved by his kinsman's misfortune, and had vowed to ruin the Warden, who was the cause of injury to Manlicken. But he became gradually less incensed on that account, and now bitterly complained that his happiness should be so long deferred. At last he proposed that the marriage ceremony should be performed by the bedside of the patient, alleging that he would then be invested with a greater right to superintend the husbandry, and his affairs generally. Moreover, he urged that by an early wedding it would be unnecessary to make other preparations for a feast, whereas, if it were put off, the viands already procured, which had been sufficiently expensive, would thus be rendered wholly useless.

To these reiterated proposals Manlicken did not answer a syllable, but always sank into serious and placid meditation. At length, when Peter could not but perceive the increasing satisfaction of both mother and daughter at the unceasing exertions of Hans, he would angrily seize his gun and roam about the whole day.

Neighbours and friends from distant parts continued to visit the patient. Even Father Grinselm appeared with his pot of holy water and aspersory to console his penitent. Yet the latter by no means derived edification from this source. The priest conversed with him, and declaimed against that execrable Lutheranism, which was secretly spreading wider and wider over the land, and which had already caused a considerable diminution of his income. This reflection would throw him into a paroxysm of rage, in which he would pace the room, uttering loud complaints and revilings, totally forgetting the intention of his visit and the condition of the sufferer.

Besides these visitors, George Frommer came now and then, and on those occasions Manlicken gave orders that they should be left alone, and he would turn the conversation upon worldly riches, although he well knew that Frommer always expressed himself very strongly on this text, and severely reprobated the covetousness of the opulent. "They who covet riches," observed Frommer, "fall into temptation and snares. Thou canst not serve both God and Mammon. Art thou acquainted with the story of the rich man and Lazarus? How the beggar was borne by angels into Abraham's bosom, while the rich man passed into torment? Wilt thou too surrender the hope of eternal joy for the mere enjoyment of worldly happiness?"

And why should we so much prize earthly prosperity? Speak for thyself, Manlicken, whether, notwithstanding all thy riches, thou hast felt so perfectly contented as to have nothing more to desire? Does not the approaching thunderstorm fill thee with anxious fear for thy property? or the possibility of a hailstorm alarm thee for the safety of thy crops? Dost thou think an accidental or intentional conflagration, or a destructive murrain amongst thy cattle, is impossible? Was it not thy wealth which excited the ill-will of the Warden, and eventually threw thee on a bed of pain and sickness, rendering thy daughter and poor Hans truly wretched? If we have food and raiment, let us be therewith content."

Conversations of this nature did not fail to affect the docile Manlicken. At a later period of his convalescence, a number of the friends of the Gospel assembled at his house, generally at night, when the Bible, drawn from its place of concealment, was read and expounded by Anthony Wallner. Peter was then snoring above in his chamber; Catherine, Barbara, and even Hans, though fatigued with work, were constant and attentive hearers on such occasions.

CHAPTER VI.

It was a kind of jubilee amongst all the inmates of the Schüppelhof when Manlicken, having recovered from his wounds, made his first appearance in public, accompanied by his family. Never had the air appeared to him so invigorating, or the aspect of nature presented more attractive charms. In the barns and stables, in the fields and meadows, wherever he turned his eyes, the excellent order in which he found everything drew forth his warmest approbation of Hans, who blushed and looked sheepish under such well-merited praises. For several succeeding days Manlicken was occupied in surveying his estate, taking an inventory of all his property, numbering the stores, casting up accounts, and, in short, making all those preparations which seemed indicative of an intention to deliver the Schüppelhof, with its lands and implements of husbandry in the best condition, into the hands of a purchaser.

One fine morning, some worthy farmers, whom he was expecting, called on him, and were received with great cordiality. Soon afterwards, attended by his family and the whole of his household, together with his friends, all dressed in their best attire, he left the mansion, which, during his absence, he committed to the care of the village watchmen. With firm and measured steps, and casting kind and friendly looks upon the bystanders, Manlicken walked at the head of the party. They now approached the church, the bell of which had long been heard through the fresh morning air, ringing the matins.

"Praise be to Heaven!" cried the powerful voice of the priest. "Come in on this holy day, for the sake of our Holy Lady and the blessed Patron!"

"Praise be to Heaven!" responded Peter, with delight, bending his steps to the church door; but the rest of the company, following Manlicken's example, after reverently bending their heads, proceeded on their way, leaving the bewildered Peter standing before the priest, who began loudly reviling the heretics. Beckoned by Manlicken, Peter rejoined the company, but with a mind greatly perplexed at their conduct. Thus they advanced for a long way amongst the mountains, until at last they came in sight of a lofty and precipitous rock, upon which arose a stronghold, defended by high walls, towers, pinnacles, battlements and loopholes. This fortress was the castle of Werffen, the residence of the

rigorous Warden, the Baron Von Motzel. The procession in a long file passed up the narrow winding path that led to the castle. It was not, however, until they had given in their names, and the cause of their visit, together with assurances that they were unarmed, that the drawbridge was lowered for their entrance.

In the spacious judgment-hall, on an elevated seat under a canopy, the powerful baron was enthroned; two scribes were seated near him, who, for want of other employment, were industriously mending their pens. After the usual salutation of respect, Manlicken stepped forward, and solicited a patient hearing.

"What brings thee hither on a day on which no suits are preferred?" said the Warden. "Though I have certainly been apprised of thy visit, I am still ignorant of its motive. I understand that thou hast been ill for some time? Perhaps the near approach of death has induced thee to make thy last will? Yet for what purpose is this numerous attendance?"

"Thou hast almost divined the true nature of my business, Baron Von Motzel. It actually does relate to a will, although not my own, but that of my deceased kinsman, Andrew Pommer."

"He that left thee the beautiful Schüppelhof and all its appurtenances?"

"Just so," said Manlicken, "and I now appear before your worship, in order to cancel it before these respectable witnesses."

"How! do I rightly understand thee?"

"Assuredly; but first allow me a little explanation."

These words produced the greatest astonishment in the minds of all present. Even his own relations were surprised; but Manlicken calmly continued: "Your worship may probably remember, that both my parents died when I was very young, leaving me only a small cottage in the village and a plot of ground for my support. I was an orphan of eleven years of age when my wealthy kinsman, Andrew Pommer, took me to his home. He wished to have me as a substitute for a worthless youth, his only son, who, after having inflicted every possible grief upon his father's heart, absconded, leaving no trace of where he had gone. He was sought for in several countries, but without the desired intelligence being obtained. The conjecture of the elder Pommer, that his son might no longer be in existence, was duly confirmed by the report of an imperial sergeant-major who visited the Schüppelhof. He averred that he had known young Pommer, who enlisted as a musketeer, and had died in a hospital within a few weeks of his arrival at Vienna. My kinsman therefore bequeathed his estate to me. About twelve years ago, towards the close of a stormy day in autumn, a man, miserably clad, leading a little boy trembling with cold and hunger, came to the house and urgently besought shelter, which was freely given to him. The poor creatures, after having eagerly swallowed the food set before them, and drunk a little wine, withdrew to their room, where, overcome by fatigue, they both fell into a profound and deathlike slumber. About midnight I was aroused by cries of agony. I sprang hastily from my bed, and went into the adjoining chamber, into which the strangers had been shown. There I found the boy still in a sound sleep, but the father was struggling in the powerful grasp of death. With his last breath he implored me to take care of his child, whose certificate of baptism he had with him; and before medical aid could arrive his soul had departed from its frail tenement. The stranger, as I discovered from his passport and marriage certificate, proved to be no other than old Pommer's fugitive son, and the boy,

his child, is the same lame Peter who now stands in your worship's presence, and whose name is, therefore, not Doehele, but Pommer."

When the assembly had a little recovered from their astonishment, Manlicken resumed the thread of his narrative, and thus continued:—"I conscientiously discharged the duty I had undertaken, I treated the little boy as my own child, allowing him to choose the employment for which he evinced most inclination. A secret voice, however, continually admonished me that I no longer possessed the Schüppelhof by right, and that it belonged in reality to the grandson of the testator. I confessed my doubts and scruples to Father Grinselm, and received absolution; I gave much and often to the church, and also to the poor; but it was all in vain, the voice within my heart never ceased to be heard. In order to ensure peace of mind, I decided on giving Peter Pommer my daughter in marriage, with the estate as a dowry; and I was on the point of sacrificing my poor child Barbara to my selfish views, but I thank God that my fall from the raft into the Salza preserved my soul from a still more fatal abyss. In thy presence, then, my lord baron, and before these witnesses, I surrender to Peter Pommer all my claims to the Schüppelhof;" and then addressing the bewildered Peter, he said, "I have never been idle, as thou well knowest, cousin Peter; but whatever I have acquired since I have had possession of this property, thou wilt find duly accounted for to a penny. Enjoy thy estate in peace. Catherine, my beloved wife, thou wilt surely not repine at exchanging the stately dwelling for an humble cottage, since thy husband by that means preserves his soul from danger. And thou, my good Barbara, wilt not thou rejoice, since thou canst now select the partner of thy heart? We are now become poor, but we shall not feel the pressure of want. One word more, Peter; let me commend to thy care the cattle of the Schüppelhof, from the powerful steer to the smallest chicken. Do not unnecessarily cut down the tall and beautiful pine-trees in the wood, but endeavour to improve the meadows and fields. I earnestly commit my late servants to thy protection; faithful, honest, young men; painstaking and active maidens. Above all, take care of the good Hans Weinleidtner. To him leave the arrangement of thy property. He is another Joseph, in whose hands everything prospers with a twofold increase. And now, my children," addressing the servants, who stood amazed, "give me your hands in farewell greeting to me, and I pray you to offer them to your new master, in token of that fidelity which you must render to him."

Old and young, with interrupting sobs, obeyed the directions of their beloved master; but when it came to Weinleidtner's turn to give his hand to Peter, he said, sullenly, "No, I will never do that, I will continue to be thy servant, Manlicken."

"Hans, that cannot be," said Manlicken. "I scarcely know whether I can find bread enough for my own family, much less can I keep a servant in my cottage."

"Where there is enough for five there is enough for six," said Hans. "Besides, I do not require wages, at least in money," casting a significant glance at Barbara, who, fully comprehending his meaning, blushed deeply. "Make no objections, sir, thou art still weak from illness, and cannot yet bear fatigue. Let me at all events set thy affairs in order, and then we can arrange further."

"Give me thy hand, my good Hans," cried Manlicken, with emotion, "and thou too, Barbara," and joining both their hands together he said, "Be lovers in the eyes of the world as ye have hitherto been in your

hearts towards each other. I here betroth ye, for ye are worthy of one another. In good truth, my friends," he added, addressing the witnesses, "I have already enjoyed more satisfaction from this decision and arrangement than the entire Schüppelhof is worth."

The Warden now beckoned the speaker aside. "A word with thee, Manlicken," he said, in a whisper. "What has become of the bond for four hundred florins which thou hadst from me? In thine altered circumstances it can no longer be of any use to thee. As a prudent man, thou comprehendest my meaning. Wilt thou return it to me at once?"

But Manlicken, surprised at the demand, answered him, "Your worship, the amount being the produce of the Schüppelhof, it henceforth belongs to Peter Pommer, the rightful proprietor. I have, therefore, put him in possession of the document, and I have no longer any concern in the affair."

His face flushing with anger, the baron exclaimed, "Thou art ignorant as a child—"

"Yes, your worship," said Manlicken, interrupting him, "and I will continue even as a child, for 'of such is the kingdom of heaven.'"

"Dost thou pay the expenses of this foolish business?" was the question the Warden now addressed to Peter Pommer, who, starting as if from a dream, made an awkward bow, and replied, with all humility, "As your worship pleases."

The latter, muttering something between his teeth, dismissed all the company excepting Peter, whom he called back from the assemblage. Much as the latter dreaded the wicked Warden, yet he was glad to find himself freed from the presence of Manlicken, who, although he had given him a beautiful estate, thus cruelly refused him his beautiful daughter. He felt quite at a loss to know in what manner he should behave towards him—whether to thank or to upbraid him.

But Manlicken, with a contented mind displayed on his countenance, turning, ere their homeward journey, to Anthony Wallner, who had been present at the transaction, inquired whether his conduct had met with his approbation. With earnestness Wallner replied, "Thou hast only done thy duty, Manlicken, and even after we have accomplished that, we ought still to confess ourselves unprofitable servants."

Afflicted at this severe sentence, Manlicken, whose pleasing anticipations were somewhat disappointed, cast his eyes on the ground and remained silent.

"Do not misunderstand me," the scribe mildly said, by way of comfort to him. "Thou hast taken a great step towards thy peace in yielding up so cheerfully the property of which thou wert unjustly possessed; but if thou wouldst be fully worthy of our Saviour thou shouldst be ready to offer him everything—fortune, wife, child, and even thy life. Art thou capable of this?"

Manlicken pensively gazed on all who were dear to him, and then meekly replied, "I will not tempt the Lord, and therefore I leave thy question unanswered. His will be done; praised be his name."

HOW THE PRESIDENT IS ELECTED.*

On the third day of this month the people of the United States will make their choice of a new President; and on the fourth of March, 1869, the successful candidate will be inaugurated, in as much state as

republican principles will admit of, at the national Capitol, surrounded by the official dignitaries of the nation and by the envoys of foreign powers. The workings of American politics are so little understood in England—and indeed they are somewhat confusing to Americans themselves—that this seems a proper time to explain by what process the highest officer of the republic is chosen. The steps by which the result is reached are gradual and various: let us begin at the beginning, and briefly follow the "movement" which results in the choice of a President, until that end is reached. The final election taking place in the autumn, the subject begins to be mooted in the preceding winter. The two great parties—Republican and Democratic—begin to bestir themselves to look about for a candidate, and to "pull the wires" for the purpose of securing that man as their nominee who is most likely at once to catch the popular vote, and faithfully to carry out the principles of the party if elected to the chief office. When the time approaches for the election, of course there are a number of men in both parties spoken of as candidates, and between whom the preliminary choice is to be made.

The first thing to understand is, that the profession of politics in America is carried on entirely by nominations, caucuses, and conventions; and that it is very rarely that any candidate proposes himself to the people for any office, however insignificant, unless he has received the formal nomination of a convention of his party. In England, the candidates for Parliament propose themselves, or their friends propose for them; there is no mustering of the party to which they belong in formal convention, no balloting for candidates of the party, no majority of a convention necessary to a man in order that he may stand a fair chance of being elected. The first movement in America, in view of an approaching presidential election, is to call a ward-meeting of the party—each of the two parties holding separate meetings, of course—in the cities, or a "town-meeting" in country towns. All persons who belong to the party which has called the meeting through its local committee, are admitted to participate and to vote in it; but such meetings are not seldom "managed" by two or three local politicians, who know "the ropes," and in whom the body of the party place their trust.

These ward and town meetings get together in the winter preceding the presidential election, and choose a certain number of delegates to the "state convention" of the party. The "state convention" is a body of delegates chosen from all the wards and towns of the state—each state in the Union having its separate state convention—which assembles in some central or important city. Each party holds its own state convention: that need hardly be said. When the state convention, in its turn, meets together—usually some time in the spring before the presidential election—they proceed to nominate by ballot (a majority securing a "nomination" of a candidate) their choice for the state officers, namely, the governor, secretary, attorney-general, and so on, of the state. They then vote for a certain number of men for delegates to the national convention of the party. The number of delegates thus elected corresponds to the number of congressional representatives and senators from the state, which varies in each state.

When, in all the states, the party has made its choice of delegates to the national convention, this largest and most important of party assemblages is summoned to convene in one of the large cities. From what has been said it will be understood that the national con-

* We are indebted for this paper to Mr. George M. Towle, of the American Consular service.

vention is composed of delegates from all the states in the Union, each state convention sending a certain number, and that the number of delegates in the national convention exactly corresponds to the number of the National Senate and House of Representatives added together. The interest of the party, of which the national convention is the supreme power and authority, concentrates throughout the country, as may be easily imagined, upon the period of its meeting; while the hostile party regards its assembling with almost equal interest, as by its action they will learn who is to be the opponent of their own candidate for the Presidency of the United States. As the time approaches when one or other of the great party conventions is to meet, the people begin to conjecture, the newspapers to discuss, and the politicians to calculate, who will succeed in winning its choice. Often the state conventions, having a positive choice among the many names offered, pass resolutions "pledging" the delegates whom they elect to the national convention to vote for such and such a person for the presidential candidacy; and when a number of state conventions do this, it enhances the excitement with which people anticipate the meeting of the larger body, as the rivalry of various prominent persons thus becomes sharper and more distinct. As the time for the assembling of the national convention approaches, the wire-pulling and manœuvring of the politicians becomes more and more earnest—some, because they hope to reap a reward in the shape of offices, in case the man they are working for wins, and others, less selfish, working with a will from party zeal or personal enthusiasm. Multitudes of these nervous and excited folks flock to the city where the convention is to meet. The hotels and boarding-houses are full to overflowing, and the halls and corridors resound with excited discussions, and busy conferences, and loud-talking crowds.

As large a hall as can be found is engaged for the sessions of the convention; sometimes (as when the Republican convention, which nominated Lincoln, met at Chicago in 1860) a huge extempore wooden building is erected on a vast area of ground, and called, in stump parlance, a "wigwam." This building is covered with flags and festoons, and other national emblems; it is fitted up within with a large broad platform fancifully decorated, and supplied with rude but striking portraits of the party chiefs; long rows of wooden benches rise one behind the other, for the delegates, and there are rudely constructed galleries for those who are fortunate enough to obtain tickets as spectators. The assembling of the national conventions, and afterward the presidential election, are to Americans, in one respect, what the Derby day is to Englishmen—the occasion for an unlimited amount of wagers. Bets run high on the various names when the convention meets; and the first morning the "wigwam," or hall, is surrounded by immense crowds, who listen to the speeches of some politician who "spreads himself" outside the building, while the convention is organising within.

The first day of the session is occupied in electing presiding officers and secretaries, examining the credentials of the delegates and receiving them, and, if there is time left after these tasks are over, in listening to some distinguished party orator who happens to be present, and who regales his hearers with a most eloquent harangue on "the issues of the hour." The national conventions contain, it need hardly be said, many delegates who have held high office, and are well known in the country; for the foremost leaders of the party in each state are chosen as delegates to the

higher body. You will find governors and generals, ex-plenipotentiaries and ex-cabinet ministers, members of congress and judges, among the number of those who have got together to choose the party candidate for president. On the second day of the convention's session, all preliminary and organising business being disposed of, the chairman announces that the next thing in order is to ballot for a candidate for the presidency. This creates great confusion and uproarious excitement: delegates huddle together in groups, rush about with slips of paper in their hands, and are most unwilling to "come to order." It should be said that the delegates of each state, having chosen one of their number as the "chairman" of the delegation, sit together; and the way the voting is done is, that this chairman collects the votes of the several delegates of his state, and announces them to the convention. Although it is called "balloting for a candidate," the mode of voting is *viva voce*, and not by ballot; the chairman of the different delegations announcing the votes as they are called on.

Before the voting begins, candidates are proposed to the convention, with brief but grandiloquent speeches by various delegates; one jumps up and says, "The New York delegation nominates Horatio Seymour;" another, "I beg to present to the convention the name of that heroic soldier and noble man, General Hancock;" whereat there is, of course, uproarious applause from the friends of the gentleman named. When all the candidates for the nomination are proposed—every delegate having the right to propose one if he wishes—the secretary of the convention proceeds to call the states alphabetically. For example, he calls out "Alabama!" Then the chairman of the Alabama delegation rises in his place, and says, "Alabama casts six votes for Seymour, two votes for Hancock, and one vote for Hendricks," or whatever the votes of the delegates of Alabama are; or, as in the Republican convention of last spring, "Alabama casts all her votes for General Grant!" In the Republican convention, a majority of delegates' votes decided the nomination; in the Democratic convention, it required a two-thirds vote to secure a nomination. The secretary goes on in like manner through the roll of the states, and when he has concluded, the vote is announced. If the vote results in a sufficient number for one man, he is declared by the chairman of the convention the successful "nominee"; but this result is seldom reached on a first vote. If no one has the requisite number, the balloting continues day after day, until that object is attained. Meantime, the evenings and recesses are taken up by innumerable meetings of the different state delegations and friends of the respective aspirants, coalitions are effected or fail, "combinations" are made, and the "wire-pullers" and outside politicians work with desperate pertinacity and earnestness.

When the convention at last succeeds in making a choice, the scene is one which mocks description, and such as is not, perhaps, witnessed at any other time or place in the civilised world. As soon as it is known that a man has received the requisite majority, all the state delegations, who have before voted against him, hasten to change their votes, and record them for the winner of the contest. They hotly vie with each other which shall be the first to "wheel in" for the successful man; chairmen jump upon the benches, frantically gesticulate to catch the presiding officer's eye, and strain their lungs to their utmost capacity in order to be heard. Meanwhile the whole body of the convention is taken with an irresistible furore of enthusiasm,

the successful aspirant becomes all at once a very hero, and his name is shouted from every side, mingled with cheers and shouts; delegates jump on the benches and chairs, waving their hands, and the ladies in the galleries (if there are any there) shake their handkerchiefs responsively. The chairman finds his attempts to preserve order quite ineffectual: presently the roar of cannon and the shouts of the outside multitude add to the excitement of the scene; and now full-length portraits of the nominated candidate, and mottoes from his speeches, suddenly appear on the platform, and awake one more deafening shout of applause. The telegraph is busy sending the news to the remotest corner of the nation, and in a thousand towns on that evening cannon are fired, and enthusiastic speeches made.

The next day there is a repetition of the scene—somewhat, however, toned down; for the next thing for the convention to do is to nominate a candidate for vice-president, the second office on the national ticket. This is done in a manner exactly similar to the nomination of the presidential candidate; and the choice made, the convention then proceeds to adopt a “platform” of the principles upon which the party bases its appeal to the suffrage of the people. A committee, which has been appointed in the first day’s session, reports a series of resolutions, which announce the views of the party, and taken together, constitute the party “platform”—the “platform” upon which the candidates are supposed, metaphorically, to stand; these resolutions are put to vote in the convention, and generally adopted with exemplary unanimity. The last thing to do is to choose a committee, consisting of one delegate from each state, to wait upon the “nominees” for president and vice-president, tender them the nomination, ask their approval of the platform and their acceptance of the candidacy. This is done soon after the National Convention adjourns, and the nominees, in reply, write letters, which are at once everywhere published.

When both conventions have chosen their candidates and platforms, and have adjourned, the “campaign” opens. Flags, bearing the names of the candidates, are unfolded to the breeze in every city, town, and village, principally over the newspaper offices; the Republican flags this year bearing “Grant and Colfax,” and the Democratic “Seymour and Blair.” Campaign clubs are formed, meetings are held in the campaign halls, and the papers devote themselves almost exclusively to discussions of the careers, personal habits, political life and principles of the several candidates. As the time of election approaches, the meetings grow more frequent, torch-light processions get to be the order of the day—or rather, night—and the editors become more fierce and pungent in their attacks upon their antagonists. It is time to say that the state conventions, when they meet, choose a certain number (equalling the number of senators and representatives) of their partisans as “presidential electors.” The Americans do not cast their votes directly for the candidates for the presidency, but vote for presidential electors who are pledged to vote for one or other of the candidates. The whole nation votes on the same day—this year, on the 3rd of November. Each of the two parties has in each state a ticket of presidential electors. The voter chooses either the Democratic or the Republican ticket of electors, as he prefers, and deposits it in the ballot-box. Thus it is that he must vote for his party candidates for both president and vice-president; he cannot vote for the Republican nominee for president, and at the same time for the Democratic nominee for vice-president—for the electors for whom he votes are pledged to vote, when the time

comes, for *both* the party nominees; so the voter must vote for both candidates of one party or the other.

The cities and towns are divided into convenient districts for the voting, so that every voter in the land may with ease deposit his ballot within the specified hours—between eight in the morning and six at night. The election judges sit behind a desk, where there are several large ballot-boxes, having before them the register of qualified voters; as each voter comes up, he gives his name; and if it is found on the register, he is permitted to deposit his folded ballot in the boxes. Every two or three hours the votes already accumulated are counted by one of the judges, and the progressive result of the count is posted on the walls for all to see; thus some idea may be gained in the course of the day how each district is likely “to go.” This frequent counting facilitates a speedy knowledge of the popular decision at the close of the day. All through the evening of election day the telegraph wires are everywhere at work, sending to and fro the results in each state and town. Multitudes assemble about ten or eleven o’clock before the newspaper offices and in public halls, where the returns are read out to eager listeners as fast as they arrive; and so complete is the system of counting and arriving at results, that you may learn enough of them by midnight of election day to indicate whether the Grant or the Seymour electors are in a majority, and hence who will be the next president.

The elected presidential electors, who, throughout the nation, are exactly equal in number to the Senate and House of Representatives, are called, when taken together, the “Electoral College”; a majority of this Electoral College elects the president and vice-president; but as they are all pledged on one side or the other, it is practically known who is the successful candidate for president on the night of the election day. It is wonderful how the public mind calms down immediately after the election. During the fortnight before, you would almost think the community on the verge of revolution, so excited is it, and to a foreigner not used to such scenes, so seemingly violent; a week after the great day, however, you would never know that such a day had been. The community settles down to its every-day pursuits, and thinks no more of politics until Congress meets again in the ensuing December. The presidential electors who have been chosen in the several states meet very quietly, some months after the election, and proceed to give their votes as they have previously been pledged to do; and it is one illustration of the successful working of the mode of presidential elections, that since the foundation of the Republic, but a single presidential elector has voted contrary to his pledge.

The election made in the Electoral College, the result is recorded, sealed up, and forwarded to the President of the National Senate. In the month of February the Senate and House of Representatives meet together, and in presence of the united Legislature, the President of the Senate proceeds to break the seals which contain the votes of the Electoral College, to read the record, and then forthwith to proclaim and declare the successful candidates duly elected president and vice-president of the United States for four years, from the ensuing fourth day of March. On that day the president and vice-president elect proceed to the Capitol and take the oath of office; and the simple yet imposing ceremony closes with the inaugural address of the new chief magistrate, delivered from the portico of the Capitol, in presence of all the dignitaries and of an immense multitude of citizens.

A LADY'S JOURNEY THROUGH SPAIN.

CHAPTER XI.

ANY traveller passing from the southern maritime provinces of Spain cannot but feel great disappointment when he finds himself traversing the arid, dusty plains of the Castiles. These two provinces contain much that is highly interesting and characteristic. The towns are amongst the most ancient and the most Spanish, and occasionally one meets with some varied scenery, with rocks and hills and streams—but oh, those plains! Nothing but the wild monotonous prairies of the Far West can come near them in sameness and in dreariness; and in their depressing tendency on the mind they outdo the prairies. There are neither trees nor birds, hedges or inclosures of any sort. It is a singular fact that the Castilians have a positive dislike to trees, so that the burning sun has it all his own way, and everything, both animal and vegetable, seems dried up by the glaring heat. Rain is a blessing prayed for, hoped for, longed for, weeks before it really makes its appearance, and there is a general brown aspect over everything—the earth, the skin of the inhabitants, their very clothes, all are of the same sombre hue. There are very few villages to enliven the scene, and even when at long distances a hamlet does appear, the dingy colour of the houses, the windows without any glass, take nothing from the general gloom. But I must not allow my readers to think that there is no good in the Castiles, for it is not so. The Castilian of the better class is noble not only by birth, but in reality he is honourable and true; and though at times his pride has been such as to pass into a proverb, it has also enabled him to bear adversity with true courage and endurance. The peasants are very hard-working. From early morn till late at night they toil on uncomplaining, yet ready at every opportunity to lighten their toil by any amusement that presents itself. I have seen instances of open-hearted hospitality in a Castilian's cottage, which would have done honour to one much better born. They dearly love their independence, and have generally managed to preserve it.

Madrid itself has but few advantages in point of situation, excepting that imaginary one which is thought so much of in Spain, namely, its being in the centre of the country. It is in the midst of a plain; but though apparently a plain, the situation is really somewhat elevated, rather more than two thousand feet above the sea. The climate is generally supposed to be very faulty; intensely, scorchingly hot at times, and at others bitterly cold, from the exposed situation and the keen icy winds that sweep down from the mountains. As far as we ourselves were concerned, we were most fortunate. We arrived at the capital in September, and though it was warm, certainly we were none of us incommoded by the heat in any degree, though we were anything but idle during our stay. For a lengthened residence I should certainly never select Madrid. The Castilian ladies are very inferior to many of their countrywomen in their powers of attraction. They have not the soft languid grace of the Valencians, nor the exquisitely fascinating manners of the Andalusians, but many of them are exceedingly high bred, both in look and manner. I have seen a Castilian peasant girl so very thorough bred (as far as her looks and form went) that one might have supposed her possessed of the famous blue blood (*sangre azuro*) so much prized in this proud country.

The destruction of the immense number of convents

has made a very great change in Madrid. If travellers made their way direct thither from France, they would find much to attract their attention in the novelty of the scene and the contrast between many of the customs there and those in use in other European towns. Madrid is as expensive, as regards every article of food, lodging, and amusement, as any town I have sojourned in, and my experience is pretty large. We were fortunate enough to be welcomed by kind friends to their own house, so that all the trouble and annoyance of being at an indifferent hotel was spared us; and we heard from good judges that no hotel in Madrid could be pronounced really comfortable.

The sights of Madrid have been too often described to need recapitulation here. The people live chiefly out of doors, preferring the bright sun and blue sky to the dark, dingy dwellings awaiting them at home: for nothing can be more uninviting than the houses of the lower classes. On one side may be seen fierce, wild-looking men, having all the air of bandits on the lookout for an adventure; on the other, a Castilian lady, attended by her duenna, and her servant bearing the prayer-books and the squares of carpet to lay down for her when she is at her devotions—the graceful mantilla still folded around her, though, alas! it is fast disappearing out of the land. Then, again, may be seen the picturesque figure of some Andalusian, perhaps in attendance on a riding party of travellers. The variety of dress and appearance in the streets and public walks is very remarkable and very entertaining, and there are endless subjects for the pencil.

Certainly the Spaniards are a most peculiar people. The lives of the regular old Spanish families in Madrid (I do not allude to those of high rank) are as singularly unaltered as those of any people in the world. As a rule, Spaniards never stir away from Madrid at any part of the year. They live on separate floors of houses, a floor to a family; society is perfectly unknown amongst them, according to our meaning of the word, especially amongst the women, whose only dissipation from year's end to year's end is their constant attendance at the churches. Owing to the astonishing number of saints' days, there is scarcely a day in the week when there is not some especial service, some famous preacher to be heard, some especial mass to be attended; and should none of these causes bring them out they are sure of finding the churches open, and thither they go, and select some chapel where they offer up their prayers to a favourite saint. Everything connected with the outward observances of religion is to them an excitement and an occupation. The men, on the contrary, find their amusement in constant smoking. Clubs, up to a late period, were little frequented by Spaniards, but some change is creeping on in this respect. They are all for outward show, both men and women, and as long as they can manage to keep a miserable-looking pair of horses to draw an antiquated sort of carriage along the public drives, they care not what privations they suffer in their domestic arrangements. They are naturally very small eaters, and adhere strictly to the fasts enjoined by their religion. The universal siesta, that boon to the dwellers in hot climates, closes all the shops at one o'clock, till the heat of the day is over; every one retreats within doors, the streets are all deserted, even the beggars seem to disappear, and the houses are all shut up as if the inhabitants had left them. Then in the evening the whole world seems to come to life again.

The palaces of the grandees are very disappointing. They were so pillaged and injured in every way by

the French, that one can form no idea of their original state. Their dwellings are in a complete state of decadence or decay, as complete as is their own deterioration. Of course there are brilliant exceptions amongst some of the oldest houses; but, generally speaking, the *grandees*, properly so called, are very poor representatives of that old nobility once unrivalled in Europe. They are mostly small in stature, and they have a dried-up, almost shrivelled, look, as if the constant baking of their scorching sun had dried up every particle of moisture in the human frame, in the same way that it has imparted to the land the arid, brown appearance familiar to all visitors to the Castiles. There is a great want of cultivation in the higher classes at Madrid, and a complete absence of all general curiosity; they truly seem to care for nothing but Madrid, its bull fights, its churches, and, it should be added, its official life, for they are most determined seekers after employments within the official circles. No matter how trifling or unimportant the charge may be, a bit of coloured ribbon in the button-hole is a distinction coveted by all who think they have the slightest chance of obtaining it.

I have already referred to the many striking contrasts which Spain presents. What other country can bring before one, at no very wonderful distance from each other, buildings so opposite, in every single feature, as the glittering, ornamented, smiling, and most beautiful Alhambra, and the oppressively gloomy Escorial. But in order to prove my words to those who have not seen these two equally famous edifices, I will now give some account of an excursion we made to the latter during our stay at Madrid. We started quite early on a beautiful day in October—the very first day of that enjoyable month it was—and anything more beautiful than the colouring of that southern sky I had never seen, not even in Andalusia. Well might it be called “the saffron brightness of morning!” After all the monotonous brown colouring of Castile, this exquisite sight was doubly welcome to us. The road is really a very fine one, if it only led through any other country than the dreary environs of Madrid: there was not a sight or a sound to enliven the way; only a miserable population, scanty in numbers, and most forbidding in aspect. The land was apparently barren, and in the distance was the gloomy Sierra, whither we were bound. There, beneath the shelter of the rugged rocky hill, stands the celebrated Escorial, so massive and grand a pile, that even surrounded as it is by hills—nay, one may almost say mountains—it still looks a wonderful pile. Up nearly to the very gates the barren appearance of the country continues, and it is more in accordance with the gloomy thoughts brought to one's mind by this strange edifice than would have been a smiling landscape.

Most of my readers will remember that the Escorial was built by Philip II, originally with the view of founding a magnificent burial-place for the Spanish sovereigns, but as he proceeded his plans were enlarged, and not only was it formed to receive the royal dead, but it was also destined as a splendid though most gloomy residence for them during their lives. Nor was the all-powerful Church forgotten: a convent arose within the walls for the reception of a number of monks. In this strange manner did the royal bigot fulfil a vow made by him when suffering from the dread of the French army about to engage his own forces and those of his allies in a decisive battle. Contrary to his panic fear he was victorious, and in the first enthusiastic warmth of his gratitude, he fulfilled the vow he had made to erect a convent on a certain spot. Building

became his favourite pursuit, and the immense pile rose gradually under his auspices. For nineteen years after its completion (it was nearly twenty-two years before it was finished) did this singular sovereign reside within its melancholy walls, and finally he died there in 1598.

As it first appears in sight the palace has a most imposing effect, but a nearer approach rather dispels these first impressions. It has too modern an aspect, though this in reality only arises from the materials used in the building, which have in no way suffered from the lapse of time. Still, even on a near approach, it is very fine. The perfect simplicity of taste apparent in the stately pile, gives a certain indescribably grand effect that is very striking on a first view. Its situation adds greatly to its imposing aspect. It is, as it were, actually built on the rocks; and unlike any other royal palace (I might even add any other of those magnificent religious establishments of which there have been so many instances in all countries), it has no external embellishments of luxuriant nature to set it off: all is rugged, and grand, and melancholy. The very grey granite of which it is composed sends a cold shudder through one, as one thinks of the cold, cruel heart of its royal founder! But we will come inside the walls, and see what is the impression left upon the mind by the interior of this singular edifice.

The grand entrance is never opened excepting to admit the reigning sovereign, or the corpse of the monarch when brought there for interment. And most truly I may say that I have never been more impressed than by the sight of the chapel of the Escorial. Instead of entering it by stately portals, as is usually the case, this sacred edifice is approached from a dark passage. As one emerges from it, and stands at the arched entrance, it is impossible to describe the effect produced on one by the simple majesty of this chapel. After a while, you begin to wonder what it is that has produced so startling an impression. There is no ornament of any kind—nothing to interfere with the solemn feeling that one stands in a building consecrated to the worship of the Almighty: there is nothing to diminish the grandeur of the idea. All is beautiful, solemn, and imposing; everything trifling seems banished. One can hardly understand how a Roman Catholic chapel can have preserved such severe simplicity in everything belonging to it. Truly the architect of that chapel was a master in his profession. When I say there are no ornaments, I mean none of those puerile trifling decorations which, especially in Spain, so often mar the beauty of the churches; but all is in severe taste, from the sombre black-and-white pavement, to the beautiful screens of bronze and jasper.

After gazing at this beautiful chapel I was but little inclined to listen to the legends poured forth by the guides, of the relics collected by the “pious founder.” I am almost afraid to write down the number: they are said to have amounted to between seven and eight thousand. What a perversion of human intellect!

As we visited the royal sepulchre our feelings were excited almost painfully, so profoundly melancholy did this burial-place of so many great, so many mighty ones, appear to us. From the nature of the building, and its situation amid rocks and hills, the power of the wind in the Escorial must be heard to be realised. The day was a bright windy day in the beginning of October, and while in the sepulchre the gusts of wind seemed to roar, and howl, and moan, with a deep pathetic sound that was most thrilling. There by torchlight we gazed around on the embalmed mortal remains, or rather the

THE ESCORT.

dark marble cases where they reposed, in different niches.

We felt but little disposed, after this solemn scene, to go the usual round through all the fine interior of the Escorial, but still we did our duty, and brought away as the result an impression of splendid halls, grand staircases, fine libraries, cloisters, courts, and all the detail of royal and priestly residences. But we did not linger long within doors: we really felt that we required the refreshment of the outer air, the sunshine, and the verdure to be found in the royal gardens. Anywhere but in the barren neighbourhood that surrounds them they would not make much impression; but after the dreary country around Madrid, the park and gardens seemed most refreshing and delightful. There are fine trees and endless walks and drives; and we were interested when the guide pointed out the exact spot where Philip always stationed himself to watch the progress of his gigantic plaything. It is a sight worth seeing—the view of the whole pile of buildings from this elevated spot.

There is another royal residence at San Ildefonso, and our party greatly enjoyed the drive thither. A more striking road I have not often seen. The most splendid pine-trees, the giants of their tribe, grew abundantly on the rocks and mountains through which we wound. The scenery was indeed magnificent: especially after the wearisome sameness of the country we had lately passed through. We were told that this road was rendered dangerous in winter by the heavy falls of snow.

CURIOSITIES OF THE PORT OF LONDON.

BY JOHN TIMBS.

"That portion of London which is connected with the port and shipping," says a popular writer, "differs so much from the districts appropriated to manufactures, and from all others possessing a special character of their own, as to constitute one of the most distinct divisions of the metropolis." Hence it has its *Curiosities*, its historic localities and sites, with the advantage of contrasts in its busy river life: its forest of masts, its crowd of ships from all quarters of the globe—of colliers, coasters, steam-boats, and river craft in almost endless variety. Then there are its docks and its vast building-yards, its storehouses, and its wealth of merchandise—all reminding one of Sir John Herschel's oft-quoted felicitous observation: "It is a fact, not a little interesting to Englishmen, and combined with our insular situation in the great highway of nations, the Atlantic, not a little explanatory of our commercial eminence, that London occupies nearly the centre of the terrestrial hemisphere." Our route embraces, on the northern side of the river, a district extending eastward from Tower Hill, and comprising Wapping and Ratcliff Highway, Shadwell, Limehouse, Poplar, and Blackwall; and on the other side commences with Tooley Street, and comprehends Rotherhithe, and all along the river to Deptford.

Eighteen centuries ago, Tacitus described London as very celebrated for the number of its merchants and its commerce. In 211 it was styled a great wealthy city, and in 359 there were engaged 800 vessels in the import and export of corn to and from London alone. Fitzstephen thus describes the merchandise in his time:—

"Arabia's gold, Sabæa's spice and incense,
Scythia's keen blades, and the oil of palms
From Babylon's deep soil, Nile's precious gems,
China's bright shining silks, and Gaelic wines,
Norway's warm peltry, and the Russian sables,
All here abound."

Under an Act of Charles II, the Port of London is held to extend as far as the North Foreland. It however practically extends six and a half miles below London Bridge, to Bugsby's Hole, beyond Blackwall. The actual port reaches to Limehouse, and consists of the Upper Pool, the first bend or *reach* of the river from London Bridge to near the Thames Tunnel and Execution Dock; and the Lower Pool, thence to Cuckold's Point. In the latter space colliers mostly lie in tiers; a fair way of 300 feet being left for shipping and steamers passing up and down. The depth of the river insures considerable advantage as a shipping port; even at ebb-tide there are twelve or thirteen feet of water in the fair way of the river above Greenwich; the mean range of the tide at London Bridge is about seventeen feet, of the highest spring-tides about twenty-two feet. To Woolwich the river is navigable for ships of any burden; to Blackwall for those of 1,400 tons, and to St. Katharine's Docks for vessels of 800 tons. The loss of life upon the Thames, by collision of vessels and other accidents, is of frightful amount, 500 persons being annually drowned in the river, and one-third of that number in the Pool.

Billingsgate has been a quay, if not a market, for nearly nine centuries; it has been entirely rebuilt in our time. Here, in one season, 2,500 tons of salmon have been sold, and nearly two million of lobsters in one year; and, in a marvellous glut of fish, in two days from ninety to 100 tons of plaice, soles, and sprats. Nearly as much fish as beef is consumed in the metropolis. In 1550 "there came a shippe of egges and shurtes and smockes out of France to Byllyngesgate." The trade of Billingsgate is now suffering by railway competition. Since 1848 the number of vessels and boats conveying fish to the market has been gradually decreasing, while the number of carts and vans so engaged has been gradually increasing. In that year 10,442 vessels were so occupied, and only 3,733 in 1867, while in 1848 the carts and vans numbered 7,649, and in 1867, 16,762. Although, however, the vessels and boats have decreased in number, a larger class of vessels has been engaged in the fish trade; but, after making due allowance for the increased quantity conveyed by these larger vessels, there still appears to be a very considerable diminution in the quantity of fish conveyed by water to Billingsgate. About three-fifths of the whole quantity of fish consumed in London is now brought by railway.

Beyond Billingsgate is the Coal Exchange, rebuilt in 1849; in the basement are the remains of a Roman bath in excellent preservation. Eastward is the Custom House, the fifth built nearly upon the same site; it cost nearly half a million of money, or nearly two-thirds of the cost of St. Paul's Cathedral. The centre, before it was rebuilt in 1825, was decorated with terra-cotta figures of the Arts and Sciences, Commerce and Industry, the Royal Arms, Ocean and Commerce, Industry and Plenty. The river *façade* is nearly one-tenth of a mile in length.

On the opposite river-bank is St. Olave's Church, originally founded prior to the Norman Conquest, and dedicated to St. Olave, or Olaff, King of Norway, who, with Ethelred, in 1008, destroyed the first bridge at London, then occupied by the Danes. The present church is nearly on the site of this exploit, for the first bridge was somewhat eastward of the stone bridge taken down after the building of the present bridge. In the rear of the wharfs, lofty warehouses, and factories, is Bermondsey, once the site of a rich priory for Cluniac monks, founded in 1082, but now a seat of manufactures,

and intersected by railways. The monastic remains were not entirely removed until our time. Here is Horselydown, now built over, but formerly a grazing-ground for horses—hence the name.

The Tower of London, by demolition and modernisation, has lost many of its historic features; it was used as a royal palace from the reign of Stephen to that of Charles II, who last held his court here. State prisoners have been confined here to our time. The Tower is a remarkable memorial of the past, yet not to its advantage, "for the image of the children of Edward IV, of Anne Boleyn, and Jane Grey, and of the many victims murdered in the times of despotism tyranny, pass like dark phantoms before the mind." "The Traitors' Gate," through which these victims were conveyed, and the "Bloody Tower" beyond it, may be seen from the river. Two centuries and a quarter ago eleven towers were prison lodgings, besides which there were torture chambers. Upwards of 1,000 prisoners have been confined in the cells and chambers of the Tower at one time. Here is preserved the headsman's axe, probably of the sixteenth century. It is still carried in processions by the master-gaoler of the Tower. The staff is studded with brass nails over leather, now almost worn through. "When state prisoners were conveyed by barge from the Tower to Westminster to be tried, the master-gaoler stood in the bow, with the blade away from the prisoner; on the return, should he have been sentenced to death, the edge was then directed towards him. Hall gives an account of the condemnation and subsequent demeanour of the Duke of Buckingham. 'Then was the edge of the axe,' says the chronicler, 'turned towards him, and so led into a barge.'"—*The British Army, by Sir S. B. Scott.*

Tower Hill was once noted for its salubrity:—

"The Tower Hill,
Of all the places London can afford
Hath sweetest ayre."

Old Poem, 1610.

Upon the hill traitors were commonly beheaded, the last being Simon, Lord Lovat, in 1747. Lady Raleigh lived on Tower Hill, after she had been forbidden to lodge with her husband Sir Walter in the Tower. William Penn was born in a court on the east side of the hill. At the Bull public-house died Otway the poet; and "in a cutler's shop of Tower Hill," says Sir Henry Wotton, "Felton bought a tenpenny knife, so cheap was the instrument of this great attempt," with which he assassinated the Duke of Buckingham. At the south-west corner of the hill is Tower Dock, where Sir Walter Raleigh, disguised, embarked on a boat for Tilbury, but, being betrayed, he was arrested on the Thames, and committed to the Tower. Postern Row, opposite about the middle of the Tower moat, is the rendezvous for enlisting soldiers and sailors; it formerly had its press-gangs. Here the shops display odd admixtures of marine stores, pea-jackets, and straw hats, rope, hour-glasses, Gunter's scales, and dog-biscuits.

St. Katharine's Docks, just below the Tower, planned by Telford, were commenced in May, 1827, and upwards of 2,500 men worked at them till their opening in 1828; a labour of unexampled rapidity. In clearing the ground, the fine old church and other remains of the Hospital of St. Katharine (founded 1148 by Matilda of Boulogne, wife of King Stephen), with 1,250 houses and tenements inhabited by 11,300 persons, were taken down; the hospital and church have been rebuilt in the Regent's Park. The dock-walls surround twenty-three acres (eleven of water), and will accommodate 120 ships besides barges and other craft. Here vessels of 700 tons

burden may enter at any time of tide. The warehouses are five and six stories high. The vaults for wine and spirits have crypt-like arches. "Lights are distributed," says Baron Dupin, "to the travellers who prepare to visit these cellars, as if they were setting out to visit the catacombs of Naples or Rome."

East Smithfield, the area in front of the Royal Mint and the St. Katharine's Dock Office, was, in the reign of Henry III, an open field, on which was held an annual fair for fifteen days at Whitsuntide. Spenser, author of the "Faerie Queen," is said to have been born here. From East Smithfield to Shadwell runs Ratcliff Highway, in Stow's time planted with an avenue of "fair elm trees," thence continued to Limehurst or Limehost, corruptly Limehouse. In Prince's Square, Ratcliff Highway, is the Swedish Church, wherein is buried Emanuel Swedenborg; the corpse lay in state at an undertaker's hard by, surrounded with black velvet hangings, daylight excluded, and wax candles lighted. In 1790 Swedenborg's remains were disturbed to confute a Rosicrucian, who maintained that Swedenborg was not dead, and that his funeral was a sham. In 1817 a Swedish naval officer stole Swedenborg's skull, and hawked it about London for sale. The pastor of the Swedish Church recovered what he supposed to be the stolen skull, and had it placed in the coffin in 1819; but this was thought to be a female skull. A marble memorial slab was placed in the church in 1857. In 1811 Ratcliff Highway was the scene of two atrocious murders. The house of Marr, 29, Ratcliff Highway, was broken open, and Mr. and Mrs. Marr, the shop-boy, and a child in the cradle (the only human beings in the house) were found murdered. Twelve days later, Williamson, landlord of the King's Arms public-house in Old Gravel Lane, Ratcliff Highway, his wife, and female servant, were murdered at midnight. A man named Williams, the only person suspected, hanged himself in prison; the body was carried on a platform placed on a high cart past the houses of Marr and Williamson; and afterwards, with a stake through the breast, was deposited in a hole dug for the purpose, where the New Road crosses and Cannon Street Road begins. Such was the terror in London just after these murders, that Lord Macaulay knew a shopkeeper who on that occasion sold 300 watchmen's rattles in about ten hours.

From the village of Ratcliff the gallant Sir Hugh Wolloughby, on May 20, 1553, took his departure on his fatal voyage for discovering the north-east passage to China. He sailed with great pomp by Greenwich, where the court then lay. Mutual honours were paid on both sides; the council and courtiers appeared at the windows, the people covered the shores. The young king alone lost the noble and novel sight, for he then lay on his death-bed, so that the principal object of the parade was disappointed.—(*Hakluyt's Voyages.*) Strype relates that on July 24, 1629, Charles I hunted a stag or hart from Wanstead, in Essex, and killed him in Nightingale Lane, in the hamlet of Wapping, in a garden where damage was done to the herbs "by reason of the multitude of people there assembled suddenly."

Near Old Gravel Lane is the Hospital founded in 1737 by Henry Raine, the wealthy brewer, near Prussian or Pruson's Island, Wapping, and endowed it with £240 a year, and £4,000 to be laid out in a purchase. Here are schools for fifty boys and fifty girls; and in May and December annually is given a marriage portion of £100 to two young women, former inmates of the school; the bridegrooms must be inhabitants of St. George's-in-the-East, or of Wapping, or Shadwell; and the young women draw lots for the portion, one hundred new sovereigns,

usually put into a handsome bag made by a young lady of St. George's parish. In the churchyard is buried Joseph Ames, Author of "Typographical Antiquities;" he lies in a stone coffin in virgin earth, at the depth of eight feet.

Wapping, a hamlet of Stepney, runs parallel with the Thames, and was commenced building in 1571, to secure the manor from the encroachments of the river, which made the whole site a great wash; the Commissioners of Sewers rightly thinking that "the tenants would not fail being attentive to their lives and property." Stow calls it "Wapping in the Wose," in the wash, or in the drain. Wapping is thought to be derived from the ship's rope called a *wapp*, or from *wapin-schaw*, a periodical exhibition of arms which may formerly have been held upon this open ground. In Strype's time Wapping was "chiefly inhabited by seafaring men and tradesmen dealing in commodities for the supply of shipping and shipmen." Here the wholesale slopseller, the retail clothier, ship's joiners, ship's carpenters, and ship sail-makers abound. Mathematical instrument makers, with sea-charts and sounding-machines, telescopes, compasses and quadrants, side by side with azimuth tables, guide for coasting pilots, etc., were formerly here in great numbers, and a century ago Wapping had its "Mathematical Society."

Wapping has been the scene of two great fires: in 1703, when the sufferers, mostly seamen, sea artificers, and poor seamen's widows, lost £13,040; and in 1791, when were burnt 630 houses and an East India warehouse containing 35,000 bags of saltpetre, and the loss was £1,000,000.

The London Docks, immediately below St. Katharine's, were opened in 1805; John Rennie, engineer. They comprise ninety acres (thirty-five water), the enclosing walls costing £65,000; and in twelve years a million of money was expended in extensions and improvements. In 1858 were constructed two new locks to admit the immense vessels now built; each lock has twenty-eight feet depth of water. One of the wine vaults contains upwards of twelve acres; above is the mixing-house, the largest vat containing 23,350 gallons. The wool importations are £2,600,000 value. A vast tea warehouse cost £100,000 building, and has stowage for 120,000 chests of tea; and in the ivory warehouse lie heaps of elephants' and rhinoceroses' tusks, the weapons of sword-fish, etc. The great tobacco warehouse will contain 24,000 hogsheads of tobacco, value £4,800,000, and in the cigar floor are frequently £150,000 worth of cigars. In the kiln, the huge chimney of which is called "the Queen's Pipe," are burnt such goods as do not fetch the amount of their duties and the customs' charges: on one occasion 900 condemned Austrian mutton hams were burnt; on another 45,000 pairs of French gloves. In brisk times nearly 3,000 men are employed here. The two companies of the St. Katharine's and the London Docks are now amalgamated. The West India Docks lie between Limehouse and Blackwall, and their long line of warehouses and lofty wall are well seen from the Blackwall Railway. There have been stored in these docks, at one time, colonial produce worth £20,000,000 sterling, comprising 148,563 casks of sugar, 70,875 barrels, and 463,648 bags of coffee, 35,158 pipes of rum and Madeira, 14,000 logs of mahogany, 20,000 tons of logwood, etc. In the Southern, or Export Dock, which will hold 195 vessels, the ships are seen to the greatest advantage, fresh painted, standing rigging up, colours flying, etc. The East India Docks lie below the West India Docks; the water area is twenty-four feet deep, and they have a cast-iron wharf nearly one-sixth of a mile in length, in which are more than 900 tons of

metal. The water accommodation of the East and West India Docks is 112 acres. A large Chinese junk, the first ever seen in England, arrived at the East India Docks in 1848. The Victoria Docks, in the Plaistow Marshes, will admit larger vessels than either of the other London Docks; the lock-gates, cranes, and capstans, are all worked by hydraulic power. The basin covers ninety acres; the ground excavated consisted of the deposit of the Thames, which, like a vast lake, formerly covered the now green marshes of Essex; in the course of the works, British and Roman coins, Roman arms, and a circular tin shield, were discovered. The Docks of London, entirely the growth of the present century, are a fine sight: the mass of shipping, the colossal many-storied warehouses, and the heaps of merchandise from every region of the globe, justify the glory of London as "the great emporium of nations" and "the metropolis of the most intelligent and wealthy empire the sun ever shone upon, and of which the boast is, as of Spain of old, that upon its dominions the sun never sets."

South of the West India Docks are the New Docks at Millwall, which will be 204 acres in extent; the dock completed is the largest in the port of London. Another new dock, of twenty-four acres, sufficient to accommodate more than 200 large ships, is now in course of excavation.

It was at Wapping that Lord Chancellor Jeffreys, when James II abdicated the throne, sought to shelter himself from popular indignation. Jeffreys fled hither in the disguise of a coal-porter, and was captured in the Red Cow ale-house, in Anchor and Hope Alley, near King Edward's Stairs. A scrivener, whom Jeffreys had formerly insulted, identified the disguised chancellor lolling out of a window; he was cudgelled and hurried off to the Tower; but at Leatherhead, in Surrey, where Jeffreys had a mansion, it is traditionally asserted that he was betrayed by his butler who accompanied him in his flight, for the sake of the reward offered.

The name of one of the outlets to the Thames preserves the memory of many a tale of murder and piracy on the high seas. Here, in Stow's time, was Execution Dock, "the usual place for hanging of pirates and sea-rovers at the low-water mark, and there to remain till three tides had overflowed them; but since the gallows being after removed further off, a continual street or filthy strait passage, with alleys of small tenements or cottages built, inhabited by sailors' victuallers along by the river of Thames almost to Ratchiff, a good mile from the Tower." Maitland, in his *London*, states that not only pirates, but sailors found guilty of any of the greater crimes committed on ship-board, were executed here. "On the 20th of December, 1738, one James Buchanan, condemned at the late Admiralty sessions at the Old Bailey for the murder of Mr. Smith, fourth mate of the *Royal Guardian* Indiaman, in Canton river, in the East Indies, was carried from Newgate to Execution Dock in Wapping, to suffer for the same; but before he had hung five minutes, a gang of sailors cut him down and carried him off alive in triumph down the water. He afterwards escaped to France, as commonly reported." Pennant notes: "Execution Dock still remains at Wapping, and is in use as often as a melancholy occasion requires. The criminals are to this day executed on a temporary gallows placed at low water-mark; but the custom of leaving the body to be overflowed by the sea-tides has long been omitted." (*Pennant's London*, 5th edition, 1813.) We see the gibbets and chains in one of Hogarth's prints of the Idle Apprentice.

Among the notabilities of Wapping was Ames the antiquary, who was here in business as a ship-chandler. A brother antiquary says of him: "He was a person of vast application and industry in collecting old printed books, prints, and other curiosities, both natural and artificial." John Day, with whom originated "Fairlop Fair," in Hainault Forest, was a block and pump maker at Wapping, and the fair grew out of the annual "bean-feast" to his workmen. Curiously enough, the fuchsia was first reared here in England; a single plant was brought hither from the West Indies, and being seen by one Lee, a nurseryman, it became in the next flowering season the parent of 300 fuchsia plants, which Lee sold at one guinea each.

The wood-built wharf and house fronts towards the river have, for the most part, been displaced; but victuallers' houses with nautical signs abound. Among the thirty-six taverns and public-houses in Wapping, High Street, and Wapping Wall, we find the signs of the Ship and Pilot, Ship and Star, Ship and Punch-bowl, Union Flag and Punch-bowl, The Gun, North American Sailor, Golden Anchor, Anchor and Hope, The Ship, Town of Ramsgate, Queen's Landing, Ship and Whale, The Three Mariners, and The Prospect of Whitby. Between numbers 288 and 304 are "Wapping Old Stairs," remembered by the old sea-song.

Pennant called Blackwall the upper part of the eastern side of the Isle of Dogs, the eastern end of London, "being nearly a continual succession of six miles and a half of streets from hence to Tyburn turn-pike." Dr. Johnson named Wapping as a place where "men of curious inquiry" might see strange modes of life; and he recommended Boswell to "explore Wapping." "We accordingly," says Boswell, "carried our scheme into execution in October, 1792, but whether from that uniformity, which was in a great degree spread through every part of the metropolis, or from our want of sufficient exertion, we were disappointed."

Limehouse, between Wapping and Poplar, is, according to an entry by Pepys, named from a limehouse that had been in the family of Captain Marshe for 250 years; though Stow, as already stated, has it "Limehurst, or Limehost, corruptly Limehouse."

The church, St. Anne's, designed by Hawkmoor, a pupil of Wren's, has the highest clock (130 feet) in the metropolis, not excepting St. Paul's; the interior of the church, and a fine organ, were destroyed by fire on Good Friday morning, 1850, but have been restored. The turrets in the steeple resemble those in the quadrangle of All Souls' College, Oxford.

Poplar, or Poplar, is named from the multitude of poplar-trees (which love a moist soil) growing there in former times. George Steevens, the Shakspeare commentator, was the son of a Poplar mariner. His body is buried in Poplar Chapel, where is a fine monument to his memory by Flaxman. The Isle of Dogs is part of Poplar Marsh. Here Togodumnus, brother of Caractacus, is said to have been killed in a battle under Plantius, A.D. 46. Traditionally the isle was named from the hounds of Edward III being kept there for contiguity to Waltham, and other royal forests in Essex. Again, the Isle of Dogs is said to be corrupted from Isle of Ducks, from the wild fowl upon it; and Pepys speaks of "the unlucky Isle of Dogs." Alderman Cubitt, twice Lord Mayor, built here "Cubitt Town," and a large Gothic church. The isle is now partly covered with stone wharfs, iron ship-building yards, and chemical works. Adjoining are the dockyards of the Wigrams and Greens, formerly Barry's, mentioned by Pepys in 1660. The picturesque old masting-house is 120 feet high. Near

the principal entrance to the West India Docks is a bronze statue of Milligan, by whom the docks were begun and principally completed. The working men of the Isle of Dogs number some 15,000 men, engaged in the factories and ship-yards, for whom has been formed a free library, to provide them with reading for evenings too often spent in dissipation. The island is a diluvial deposit, in which has been found a subterraneous forest of elm, oak, and fir-trees, eight feet below the grass; some of the elms were three feet four inches in diameter, accompanied by human bones and recent shells, but no metals or traces of civilisation.

Blackwall, with its large taverns, is noted for its delicious little fish, whitebait, caught in the reach, and directly netted out of the river into the frying-pans of the "bait kitchens." Whitebait was long thought to be the young of the shad; then a distinct fish: it is now proved to be the young of the herring.

Shadwell is a continuation of the buildings along the river; it was formerly called Chadwelle, supposed from a spring, dedicated to St. Chad, within the churchyard. Pennant describes the frequent docks and small building-yards here; the prow of a ship and the hulls of new ones appearing at numbers of openings. The church, re-built in 1820, has a very beautiful steeple.

Wapping is at one end of that famous work, the Thames Tunnel, beneath the Thames, and Rotherhithe at the other. A tunnel had previously been proposed from Gravesend to Tilbury, by Dodd, but abandoned as impracticable; and next was commenced a tunnel to connect Rotherhithe and Limehouse, by a Cornish miner named Vasey. After five or six years' work this was given up. In 1823 Brunel planned the present tunnel, from the operations of the teredo, a testaceous worm covered with a cylindrical shell, which eats its way through the hardest wood. In like manner Brunel planned the shield apparatus, a series of cells in which, as the miners worked at one end, the bricklayers built at the other, the top, sides, and bottom of the tunnel, which is a brick arched double roadway and footway. At full tide it is seventy-five feet below the surface of the water. The shaft on the Rotherhithe side was first commenced; then the horizontal roadway; and next the Wapping shaft, where, at some distance below the houses that stood on the spot, were found the remains of a ship-builder's works, including part of a ship, a ship's figure-head, and a great quantity of oak. The irruptions of earth, water, and gas explosions during the tunnel works were fearful; yet with all these perils but seven lives were lost in constructing the Thames Tunnel, whereas nearly forty men were killed in building London Bridge. The tunnel cost about £454,000; its total length is 1,140 feet. It is now to be converted into a railway. Brunel has left a minute record of his great work, which has been paralleled, as an engineering triumph, by Stephenson's tubular railway bridge.

Rotherhithe, or Redriff, as it is corruptly called, unlike Wapping, is of great antiquity; it is thought to be named from the Saxon *redhra*, a mariner, and *hyth*, a haven—i.e., the sailor's harbour. It was here that the famous trench, or canal, of Canute was commenced in order that the invader might avoid London Bridge. Maitland, in 1739, imagined he traced this canal from Rotherhithe to Newington Butts, and thence to the river at Vauxhall; but two more probable and far shorter courses have been indicated for this canal. And is it not possible that the draining works executed by the Romans left certain watercourses which might have been made available by the invading fleet? In the reign

of Edward III a fleet was fitted out at Rotherhithe by order of the Black Prince and John of Gaunt for the invasion of France. And it was off Rotherhithe that Richard III was so alarmed at the shouts and array of the malcontents whom he came to appease, that he hastily returned to the Tower, whilst the infuriate people swept on with their excesses to the Marshalsea and Lambeth. Lambard states that Henry IV "lodged in an old stone house here while he was cured of leprosie;" and two of Henry's charters are dated here, July, 1412.

St. Mary's Church, close to the Thames Tunnel shaft, was rebuilt in 1736-39, upon the site of the old church, which had stood 400 years. Gataker, the erudite Latin critic, was rector from 1611 to 1654; he was imprisoned in the Fleet by Laud, and is buried in Rotherhithe churchyard. Here also lies Prince Le Boo, a native of the Pelew Islands; over his remains a monument has been erected by the East India Company, in testimony of his father's humane and kind treatment of the crew of the *Antelope*, Captain Wilson, wrecked off Goo-roo-raa, one of the Pelew Islands, on the night of August 9th, 1783. The young Prince Le Boo died in his twentieth year from small-pox, in Captain Wilson's house in Paradise Row, Rotherhithe.

The parish registry, commencing 1556, contains many entries of ages, from ninety to ninety-nine years, some of one hundred and twenty years! Admiral Sir Charles Wager possessed the manor between 1740 and 1750. The brave Admiral Sir John Leake was born here 1756; but Admiral Benbow, stated by Manning and Bray to have been born at Rotherhithe, was a native of Cotton Hill, Shrewsbury.* Lillo, the dramatist, who wrote "*George Barnwell*," was a jeweller, living at Rotherhithe in 1745.

A very interesting literary association is Swift's "Captain Gulliver," who, he tells us, was long an inhabitant of Rotherhithe. There is such a reality given to this person by Swift that one seaman is said to have sworn that he knew Captain Gulliver very well, "but he lived at Wapping, not at Rotherhithe." Lord Scarborough was told by the master of a ship that he knew Gulliver very well, but that the printer had made a mistake,—"he lived in Wapping, not at Rotherhithe." "It is as true as if Mr. Gulliver had spoken it," was a sort of proverb among his neighbours at Redriff. Rogers, the poet, remarked in the churchyard at Banbury several inscriptions to persons named Gulliver, which inscriptions he found mentioned in "*Gulliver's Travels*" as a confirmation of Gulliver's statement that his family "came from Oxfordshire," so completely is the joke kept up.

We have spoken of whitebait. Another little fish, though now neglected, is the *twait shad*, which is found in the Thames towards the middle of July; it was caught as high up the river as Putney, but now rarely passes London Bridge, and is taken in the greatest abundance a little below Greenwich. Shad Thames, a narrow water-side street, was named from the quantities of shad taken here, and in the Thames off Horselydown, and cried about the streets as herrings, mackerel, and sprats now are. Strange fish have strayed here. In 1391 a dolphin, ten feet in length, disported himself in the Thames at London to the bridge. Evelyn tells of a whale, fifty-

eight feet in length, killed between Deptford and Greenwich in 1658. Pennant tells of a two-toothed cachalot, twenty-one feet long, taken above London Bridge in 1783. At Grays a whale of the above length was taken in 1809, and another in 1849.

Rotherhithe, like Wapping, has its numerous docks, and a similar population; but the Surrey side has also its flour-mills and manufactories, and the wharfs for the coasting trade of England, which are all to be found between the Tunnel and London Bridge. The oldest portion of the Commercial Docks, according to Stow, occupies the commencement of Canute's Trench, through which the course of the river was diverted when the first stone bridge across the Thames was built, in the reign of King John. The present Commercial Docks originated in the "Howland Great Wet Dock" in 1660; subsequently the Greenland whale-fishery, with the vessels, houses, boilers, and tanks, was located in this dock. Dodd projected a ship canal from Rotherhithe to Vauxhall. After the whaling trade declined it became the Baltic, and then the Commercial Docks; they extend over 150 acres; the ponds will float 50,000 loads of timber, and the yard will take 4,000,000 deals. The cargo of one timber ship would cover thirty-two acres, were the deals placed side by side. Here also are the Grand Surrey Docks, the new works of which, in 1858, cost upwards of £100,000. The docks of the Thames are of surprising extent: they comprise hundreds of acres of water, surrounded by miles of walls, and sheltering thousands of ships; here have been spent millions of money, and all in about half a century.

The shipping and craft in the river have lost much of their picturesqueness within memory. We miss the tall vessels with their high forecastele, and the gilded state barges of the Sovereign, the Admiralty, and the City Companies. The steam navigation of the Thames exceeds that of any other river in the world. The first steam-boat left the Thames for Richmond in 1814,* the next for Gravesend in 1815, and in the same year for Margate. The Gravesend steamer soon superseded the sailing-boats with decks, which, in 1737, had displaced tilt-boats mentioned in the reign of Richard II. The Margate steamers in like manner superseded the "hoy." The steam traffic has attained vast numbers; in the year 1861, 3,207,558 passengers landed and embarked at one pier. The numbers have, however, been greatly reduced by railway competition.

Steam ship-building on the Thames dates from about the year 1836. The largest steam-ship of wood was the *President*, 268 feet in length, and 600 horse-power, lost on her voyage from New York. In iron ship-building the greatest achievement has been the *Great Eastern*, by I. K. Brunel and John Scott Russell, built at Millwall in 1857, length 680 feet. The fastest steamship is the *Mahroussa*, with a speed of twenty miles an hour: she is said to have cost £166,000, and was built in the Thames. The iron ship-building works are of cyclopean vastness; and not only in the bulk, but in the exquisite finish of machinery, are unrivalled.

OUR DUST-BINS.

DURING the hot months of this year's summer, the subject of dust-bins in their sanitary relations was discussed in the newspapers. A writer in the "*Builder*"

* Yet the street is named. In Mr. Serjeant Burke's "*Celebrated Naval and Military Trials*," are given some very interesting particulars of Admiral Benbow's family; showing there to be no authority for depriving the Salopians of the honour of Benbow's birthplace at Cotton Hill. The above collection of trials has the twofold advantage of being adapted for popular reading, at the same time that the legal and technical details are most carefully given.

* This was the first steam-boat which *plied for hire* on the Thames. Brunel had previously made a voyage to Margate in a boat of his own, propelled by a double-action engine, and met with such opposition and abuse that the landlord of the hotel where he stopped refused him a bed!

offered some useful suggestions on a matter affecting the health not only of households but of the public generally. These receptacles of all kinds of decaying matter are too often complete fever-nests, offensive to neighbourhoods and dangerous to the inmates of houses. To prevent the deposit of vegetable and animal refuse with cinder-ash, it is suggested that the top of the dust-bin should be covered with a padlocked grating, which would at the same time secure the sifting of ashes—a process which servants are in general too lazy to undertake. It would be also well if local officers of health could be empowered occasionally to visit the basement of houses, in order to ascertain the condition of the dust-bins, drain-pipes, and other matters, too often neglected. An article in the "Quarterly Review" discusses the subject with a wider scope, and contains curious facts about the commercial uses of dust-bins, referring especially to those of London.

The refuse of one household seems an insignificant matter in detail, and not worthy of much attention; but, when it is multiplied by the 500,000 houses in the metropolis, it forms an item of no mean importance, and is of no inconsiderable value. Formerly, the dust-yards, or lay-stalls, as they were called, were conspicuous by their hills of refuse, which towered high over the surrounding houses; upon these highlands swine depastured, and we are told that there was no fattening ground like these dust heaps, full as they were of all kinds of perishing animal and vegetable refuse. But the health of the metropolis was of more importance than the fattening of hogs; and for years past the dust contractors have been obliged to separate and disperse their rubbish as soon as the dust carts arrive. A more interesting example of the use of refuse could not well be afforded than we find in the yards of these dust contractors, nor a more pregnant example of the value in the aggregate of that which householders consider a mere nuisance, to be got rid of as quickly as possible. That which we throw away in the dust-bin day by day, because we fancy it is an eyesore and past repair, is, in fact, but arrived at that stage in its existence at which it is destined to reascend in the scale of value, and once more minister to the wants of men. There is not one particle in the heap the scavenger removes from our houses that is not again, and that speedily, put into circulation and profitably employed. No sooner is the dust conveyed to the yard of the contractor, than it is attacked by what are called the "hill women," who, sieve in hand, do mechanically what the savant does chemically in his laboratory, separate the mass, by a rude analysis, into its elements. The most valuable of these items are the waste pieces of coal, and what is termed the "breeze," or coal-dust and half-burnt ashes. The amount of waste that goes on in London households in this item of coal can hardly be conceived, unless the spectator sees the quantity that is daily rescued in these yards. It may be measured by the fact, that after selling the larger pieces to the poor, the refuse "breeze" is sufficient to bake the bricks that are rebuilding London. Most of the dust contractors are builders as well, and the breeze is used by them for the purpose of embedding the newly-made bricks into compact square stacks, which are seen everywhere in the suburbs of London. The breeze having been fired, the mass burns with a slow combustion, aided by the circulation of air, which is kept up by the method of stacking; and in the course of two or three weeks the London clay is converted into good building material. Thus our houses may be said to arise again from the refuse they have cast out, and not

only are the bricks baked by their aid, but they are built in part with mortar made from the road scrapings, which is pounded granite, and combines very well with the lime and ashes of which the mortar is composed. Nay, even the compo, with which some of the smaller houses are faced, is very largely adulterated with this particular refuse.

The other constituents of the dust heap are separated by the sifters with the utmost rapidity. Round every hillock, as it is emptied, they congregate with their sieves; and in a very short space of time bones, rags, paper, old iron, glass, and broken crockery are eliminated from the mass and piled in separate heaps. The bones are put to a score of different uses. Several tons are picked weekly out of the metropolitan dust; but, of course, this does not represent the whole of the animal refuse of this kind, but only that taken from cooked meat. After we have discussed the joint at the table, there is still much value remaining in the residual bones. They go immediately to the boiling-houses, where every portion of fat and gelatine they can yield is extracted; the former goes to the soap-maker, the latter is utilised to make the patent gelatine packets now in use for a score of different purposes. The bones that possess any size and substance are used by the turners, and are converted into the hundreds of nic-nacks for which they are suitable; possibly, good reader, the same bone you may have picked at dinner re-enters your mouth after many changes in the shape of a tooth-pick or toothbrush! whilst the smaller pieces are calcined, and form the very toothpowder you use with it. But the grand destination of the smaller fragments is the earth. Ground very fine, and treated with sulphuric acid, they make the celebrated superphosphate manure, one of the best known fertilisers. Thus the old bone goes to form and nourish new bones. The wealth of England has attracted towards herself the old bones of half of the Continent, not only animal but human, for many an ancient battle-field has been searched for their valuable remains,—thereby enabling us to grow such splendid crops by supplementing the resources of our fields. Thus the threat of the Giant to Jack—

"Let him be live,
Or let him be dead,
I'll grind his bones to make my bread"—

is no fairy tale after all, but a common verity. Another very important product extracted from bones is phosphorus, a constituent of the brain and nervous system, one of the substances which give us light in the match, and without which we and our households would fare but poorly. The fat that is saved in the process of boiling goes, as we have said, to make the commoner kind of soap, or is useful to the arts in a hundred ways. What diverse forms of new life await the old bone as the rag-picker recovers it from the ash-heap! Its substance, in the form of handles of knives, chessmen, paper-knives, etc., mingles with the everyday concerns of life—its hard work and its enjoyments and intellectual amusements; whilst in its fluid and manurial products yet more astonishing changes attend it the moment it falls into the hands of the manufacturer. Its fatty particles give us cleanliness and purification in the form of the "bar of yellow;" and its phosphorus helps to give us ready illumination. The difficulty we feel in dealing with this seeming rubbish, that we kick out of the way with our foot, is to follow it out into the many diverse forms it assumes upon its resurrection.

But there are other articles in the dust-bin which await us—for instance, there are scraps of paper. These are

all carefully sorted, the white from the coloured and the printed. The soiled pieces, which cannot be profitably re-manufactured as paper, are used to make papier-maché ornaments, or dolls'-heads, etc.; the clean paper is returned to the mill, and even the printed paper has the ink discharged from it, and goes again into circulation. Old rags, of course, are valuable to the paper-maker, although the discovery of other materials will possibly render this form of waste not quite so important a matter in his eyes as it was some time ago. But what can be the destination of greasy dish-clouts? Woollen material, if clean, does not descend to the earth in the scale of civilisation; but there is too much grease in the dish-clout to go again to the mill, so it is destined to nourish the noble hop in the Kentish grounds. As the old saying has it, "When things are at their worst they mend." Woollen rags, if they happen to be dyed scarlet, are treated for the recovery of their cochineal, which is very valuable for dyeing purposes, etc.; and other valuable coloured rags are separated to be ground up and make flockpaper. But these are fancy uses: the great market for all old woollen fabrics which are too tattered to be worn, is the town of Batley and its neighbourhood, in Yorkshire, the great Shoddy metropolis. To use the words of a contemporary:—

"Not the least important of the manufacturing towns is Batley, the chief seat of the great latter-day staple of England, Shoddy. This is the famous rag-capital, the tatter-metropolis, whither every beggar in Europe sends his cast-off gentility of moth-eaten coats, frowzy jackets, worn-out linen, offensive cotton, and old worsted stockings—this is their last destination. Reduced to filaments and greasy pulp by mighty-toothed cylinders, the much-vexed fabrics re-enter life in the most brilliant forms—from solid pilot cloths to silky mohairs and glossiest tweed. Thus the tail-coat rejected by the Irish peasant, the gabardine too fine for the Polish beggar, are turned again to shiny uses; reappearing, it may be, in the lustrous paletot of the sporting dandy, the delicate riding-habit of the Belgravian belle, or the sad, sleek garment of the Confessor. Such, oh reader, is shoddy!"

We all remember how "Devil's dust" was denounced some years ago in Parliament. If it were not for this shoddy which created it, the clothes of Englishmen, both rich and poor, would be augmented in price at least five-and-twenty per cent. As it is, a cheaper woollen garment can be purchased now than thirty years ago, notwithstanding that the expenses of living have considerably augmented since that time. Formerly these old woollen rags went to the land; but since they have been brought back to their old uses, an enormous quantity of cloth-making material has been added to the general stock. As long ago as 1858, it was estimated that 38,880,000 lbs. of this rag-wool are annually worked up into cloth, and this quantity was quite irrespective of the importations from abroad, which were very large indeed. In the nine years that have elapsed since that time the quantity must have greatly increased, yielding a quantity of wool equal to many million fleeces annually! Cotton and woollen rags are both valuable commodities when separate, but of late years it has been the custom to weave the cotton and the woollen together. The warp being of the latter material and the weft of the former, thus mixed together they were both spoilt, as they could neither be converted into paper nor cloth. Many endeavours have accordingly been made to separate them. One of these for a time succeeded. The woollen fabric was saved, and the cotton destroyed; but it has, we believe, been found that the felting qualities of the

wool thus rescued were injured by the process adopted. Within these last few years the original process has been reversed. These "Union fabrics" are now placed in a closed receiver, and subjected to steam at a very high temperature. The result is that the cotton comes out pure and fit for the paper-maker; the wool is reduced to a dark brown powder, known as the "ultimate of ammonia," and is employed to enrich manures, which are poor in nitrogen. So much for old rags.

But we are far from having exhausted the contents of the dust-bin yet. There is the old iron, battered saucepans, housemaids' old pails, rusty hoops, horse-shoes, and nails from the road. All soldered articles have the solder extracted from them (as it is more valuable than the iron), and the cheaper metal is then remelted. The horse-shoe nails are not mixed with the common cast-iron, as they are much sought after by gun-makers for the purpose of making Stubb twist barrels. This is a roundabout way to get tough iron it is true, and it remains as an instance of an improved product brought about by accident: it is like the Chinese method of discovering roast pig. Perhaps, following out this idea, some quicker and less laborious method of making cohesive gun-barrels will be discovered than the banging of horses' feet upon the granite pavement.

Scraps of iron, it is found, may be made very useful in securing the copper that runs away in the streams washing veins of copper pyrites. In the Mona Company's mines in North Wales, old pieces of battered iron are placed in tanks into which these streams are collected; the copper quickly incrusts the iron, and in process of time entirely dissolves it, so that a mass of copper takes the place of the iron. The residuum, in the shape of a coloured deposit, is at times taken out, dried, and smelted. Before the adoption of this plan, a great deal of copper escaped as a refuse into the sea. Indeed, this simple laboratory device has become, during the last few years, an expedient on the manufacturing scale: the poorest copper ores, which at one time did not even pay for working, now have the metal extracted from them at a profit, by a process of which this is the penultimate stage.

Glass, so much of which in its manufactured form is destroyed in our households, is carefully collected, and of course goes again to the melting-pot. The most fragile and destructible of materials when manufactured, it is, perhaps, one of the most indestructible of all known substances; and very possibly there is plenty of it which has been melted over and over again for centuries, now doing good service in the world. Glass bottles, especially physic bottles, go to the dust-yards with great regularity, and with the same regularity they find their way back to the druggists' shops, going the same dull round year after year, and no doubt are present at the death of many to whom they have ministered. Old boots and shoes, when not too far gone, find their way to Monmouth Street, Seven Dials, where they are patched up with heelball, and made to look decent, even if they should not prove very serviceable. In any case, good sound pieces of leather are turned to account. India-rubber goloshes, and all articles made of caoutchouc, whether vulcanized or not, are remelted and mixed with the new gum, the refuse being obtainable at from 17*l.* to 18*l.* per ton, and the raw material at not less than 200*l.* a ton.

The dust-heap is now pretty well exhausted; there is the soft core and the hard core, the decaying vegetable matter, and the broken crockery. The former goes to feed the pigs, and the latter makes excellent foundations for roads.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cooper.*

THE CATHEDRAL SQUARE.

THE EXILES OF SALZBURG.

CHAPTER VII.

At the festival of Corpus Christi, in the year 1729, all the bells of the numerous churches in the capital of Salzburg were pealing from an early hour in the morning at short intervals. The neighbouring mountains re-echoed the solemn sounds. The greater part of the houses of that city, which commands so beautiful a site, were decorated with tapestry, with garlands, and with flowers. Images of the Virgin were seen in several of the streets, adorned with fresh leaves, wax

tapers, and with gold and silver, which, although counterfeit, still shed forth a dazzling splendour around. Every niche where there was a statue of a saint had been newly adorned for the occasion. Men and women, in their holiday clothes, crowded the streets on their way to church.

Near the platform of the Castle of Salzburg, by the largest and most magnificent fountain in all Germany, where gigantic horses, cupids, and artificial shells, sculptured in white marble, continually pour forth an abundant stream into the capacious basin, some servant girls, with their well-scoured pails resting on the

margin of the fountain, were engaged in conversation. Each new comer afforded them fresh material for railery; there were few against whom some witticism was not uttered by their sharp tongues.

Slowly the square became filled, and chiefly with citizens; but this time the numerous guards who were usually employed to keep order appeared quite unnecessary. At length the bells pealed from the tower, and deafening flourishes of trumpets in the cathedral, accompanied by the loud clangour of kettle-drums, announced the conclusion of high mass. Soon afterwards the principal door was thrown open, and the procession came forth with gorgeous pomp, with the archbishop in the midst. In front and by the sides of the splendid canopy, which, glittering with gold, and decorated with ostrich feathers, was held over the prince-archbishop by chamberlains, marched a multitude of guards, servants, monks, priests, and prelates. After these came a long train of the noblest inhabitants of Salzburg. From the portal of the cathedral—a masterpiece of architecture—the spiritual ruler cast an inquiring look over the square before the castle. In amazement he whispered a few words to one of the nearest chamberlains, who, taking out his watch, answered in an undertone, “Most gracious prince, it is by no means so early; indeed, the usual hour has long since passed.”

The countenance of the prince, which until that moment had worn an air of cheerfulness, now became overspread with gloom. “Luthere, redde mihi legiones!” (Restore my legions, Luther!) he sighed, as he moved forward to the extremity of the steps, on which the people knelt to receive his benediction.

In former years the place had been crowded to excess, but on this occasion only a few persons were thinly scattered over the square, and the prayers of the faithful were but faintly audible. The archbishop, as soon as possible, concluded a ceremony which was now depressing, but which once had been a source of exultation to him.

“Call the chancellor to me,” said he in a tone of command to one of his gentlemen in waiting, who was divesting him of his magnificent robes; and immediately he entered into a long conversation in Latin with the prior of the convent of the Camaldolines at Salzburg. While thus engaged, the Chancellor von Rall made his appearance, a man of wrinkled and sallow mien, who, from the specious respect and submission he evinced, seemed to have obtained full possession of his master’s mind. “Rall,” said the prince to him, “didst thou notice to-day, how—”

“How empty thy sheepfold was of the black flocks of the mountain?” the chancellor added, in allusion to the colour of the clothes usually worn by the countrypeople.

“Ah, Rall! the misguided blindness of the poor people grieves my heart.”

“Might it not rather be called their obduracy, insolence, and pride?” suggested the chancellor.

“Thou art not far from the truth,” replied the prince. “I cannot comprehend how they can exchange the pure milk of the only saving faith for the hard, unpalatable husks of Lutheran heresy. How peacefully they might dwell in the bosom of our Church, which renders the path to heaven easy to its professors! What a multitude of intercessors, and what ready means of grace does it offer to the Catholic Christian! And, on the contrary, how barren and destitute of comfort, compared with it, is the doctrine of the heretics, to the heart which needs consolation! And yet—”

“Gracious prince, thou art too lenient to these renegades.”

“I often think so,” replied his highness, “and blame myself on this account. But it pains me to punish the flock that has wandered astray.”

“But if thy clemency should occasion the evil-doers to experience the fate of those who would not listen to the warning voice of the good shepherd?”

“Thou alarmest me!” said the prince. “Ah, Rall, Rall! how often have I in tears prostrated myself before the crucifix, and besought that my understanding might be enlightened, and that means might be granted me to recall the heretics to His cross! The worthy prior, here, has now revealed to me a method which cannot fail to prove beneficial. I tried a similar plan, when I directed all the clergy in the country to explain to their congregations the vast difference between our glorious faith and this pernicious heresy. That this good intention did not succeed may be attributed, in a great measure, to the clergy, who, through their long ministration, may probably have lost much of their zeal and assiduity. I have, therefore, at the suggestion of this devout prior, resolved to employ the brethren of Jesus, the most experienced and most indefatigable champions in the service of our Lord, against the heretics. I intend to despatch, without delay, a pressing solicitation to the very reverend general of the Order for this purpose.”

With an incredulous smile, the chancellor said: “But, my gracious prince, if the boors should treat the holy brethren of Jesus in the same manner they have treated their pastors? If they should continue still to forsake the house of God, and bury themselves in the recesses of the forests to hear the Bible explained by their more learned brethren, who are but too willing to instruct them?”

“Then let them be compelled, under pain of severe penalties, to attend the service of God,” interposed the prior, vehemently.

“Thou hast hit the right mark, good prior,” said the chancellor, smiling. “This is the weak side of all farmers, and on that they must be assailed. And I would fine every one a hundred florins who was found with a Bible in his possession. This measure is sure to work miracles.”

“Fools!” exclaimed the archbishop. “The proverb, ‘*Was nutz der Kuh Muscaten*’ (What’s the use of nutmegs to a cow), is not inapplicable in this instance. Truly, my dear prior, I foresee that the Lutheran declaimers will some time or other bitterly repent that they ever entrusted the besotted people with the Bible. What an inexhaustible source of troublesome contentions, perverse constructions, and contradictions have they now opened! Even we ourselves, educated for the Church, taught by the holy fathers of the Church, and by oral tradition, are often greatly perplexed in our endeavours to discover the true sense of an obscure passage in the Bible! How, then, will the uninstructed laity arrive at the truth?”

“Although I am a layman, I can perceive that thou art perfectly right,” said the chancellor. “But the peasantry are as stubborn as their cattle, and can be convinced only by things that they see occur before their eyes. My advice, then, would be, if they continue to neglect our Church, to withdraw from them all its benefits. Let no clergyman baptize their children, marry those who are betrothed, administer sacrament to the dying, nor bury their dead in consecrated ground, as long as they remain unpurified from even the suspicion of heresy.”

“He is right!” cried the prior.

“We will try it!” said the archbishop.

CHAPTER VIII.

A SMALL waggon, drawn by two fine oxen, and laden with the few goods which Manlicken conceived he might take with him as his undisputed property, was standing in the yard of the Schüppelhof. Stroking Packfest, the house dog, whilst they shed bitter tears over him, Manlicken's two little boys were waiting for their parents, who were taking a reluctant leave of every room and corner of the dwelling. Restless and silent, Peter Pommer was walking outside the house, and occasionally directing restless glances towards the door. At last Manlicken, prepared for his departure, came forth, followed by Catherine, her eyes red with weeping, and Barbara, who was endeavouring to hide hers with the little kitten, which was the only living creature she thought she might venture to retain. Her left hand was placed in that of Hans, who was the last of the retreating group. In this manner the family approached the waggon, which, driven by one of Peter's servants, was now beginning to move onwards. At this moment, Peter, impelled by a vague sense of propriety, drew near to them.

"Farewell, kinsman," said Manlicken, calmly. "Do not suppose that from these tears we are envious of thy possessions. Thou knowest that women and children cannot easily restrain their feelings. Be happy in this house, and enjoy thy property with more peace of mind than I could possess."

Peter looked perplexed, and casting a sidelong glance at Barbara, who had already turned away from the house, he drew Manlicken aside in an awkward manner, and said, eagerly,—

"Cousin, give me thy daughter, and take back the estate and all that belongs to it. I feel that it will be of no use to me; but, on the contrary, Barbara might make a prudent man of me."

Manlicken, shaking his head, pointed with a quiet smile to the youthful pair, who were walking together hand in hand.

"I understand," said Peter, sighing. "Well, I perceive that the fair maiden prefers the handsome Hans to the lame Peter. Let them, therefore, remain in the cottage, but do thou live here with thy wife and sons."

"I thank thee for the kind offer," said Manlicken; "but, believe me, it would neither profit thee nor us. Farewell, then! May God be with thee!"

Peter gazed sorrowfully after them. As soon as they were out of sight he went into the stables, and having saddled one of the horses and unchained Packfest, he rode off at full speed.

CHAPTER IX.

"THY cousin is a niggard, at all events," observed Hans to Barbara, as she was walking by his side. "If he really were as generous as he tried to make thy father believe, he would not have allowed us to depart with empty hands. It is a great pity that such a fine property should fall to such an owner. He will soon have distilled everything into spirits. Has not the best dapple cow already disappeared, and have not three goats and a buck vanished? Even the poultry seem diminished, and all this since yesterday, whilst we were gone to set our dwelling in order. Nay, more; he must have even sold some hay and straw, for a single foddering could never have made such gaps in the stacks. I could not have stood by quietly watching the poor boys caressing Packfest, who has grown up with them, and so deeply lamenting his loss, without making them a present of him, and many things

besides. It will be long enough before we can have living inmates of the stable and hencoop."

Hans continued thus inveighing against Peter, whilst the farmer's wife seemed by her silence to approve of his sentiments; but Manlicken said, reproachfully: "The great and good God will always bestow upon us what is necessary and right for us. Let us first seek the kingdom of God and his righteousness, and all these things shall be added unto us."

Soon afterwards they came in sight of the cottage, which was henceforth to be the dwelling-place of the family. At the same time a small outhouse, which was to serve them for a stable, wash-house, and cart-house, was visible, and behind it was a narrow strip of ground, which the industry of Hans had already converted into a kitchen-garden. The little farm was beautifully situated, and commanded a fine view of the mountains. The loud barking of a dog welcomed them as they slowly advanced.

"Does not that sound exactly as if it were Packfest?" said Joseph to his brother Frank.

"I was just going to say the same thing," answered the other.

"It must be his ghost," cried both, hastening to obtain ocular evidence. At the door of the house they actually beheld Packfest, fastened by the self-same chain he always wore, whining and wagging his tail with joy at the sight of the two brothers. His boisterous delight at their approach gave rise to a number of other sounds, which seemed to proceed from the stable; and wonderful were the bellowing and the bleating, the lowing and the cackling, the quacking and the grunting, that now saluted their ears. And when Hans opened the stable door, it presented to him the appearance of a Noah's ark. Here, to his astonishment, stood the dapple cow which he had missed, the goats that had disappeared; there a flock of about thirty peaceful sheep were crowded together in a corner, carefully avoiding the neighbourhood of two fat pigs. Ducks, geese, pigeons and fowls in numbers, occupied the loft, whilst the upper part of the stable was well supplied with hay and straw.

"This is my kinsman's work," said Manlicken, uncovering his head. "My children, you should ask pardon for the injustice done to him."

This they readily did with gladdened hearts, and not the less cheerfully that they found the house, including kitchen and cellar, stocked with provisions of every kind. Nay, more: the servant had orders not to bring back the borrowed waggon and pair of oxen!

PEEPS THROUGH LOOPHOLES AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT BEDE.

"'Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd."

COWPER.

NO. XI.—THE POET COWPER A COMMENTATOR ON RECENT EVENTS

As the title for these roving essays is borrowed from the poet of "The Task," it is not surprising that, during this fast-closing year, I should often have had Cowper "before my mind's eye" when taking my loophole peeps at men, manners, and customs. And, therefore, when I lately read a book on William Blake the painter, I could not but notice how the writer, a fashionable poet of the day, went out of his way to give a gratuitous sneer at the country that was "fed by the teapot pieties of Cowper," the said country being that England which

may be proud of the pure poet of "The Task," and the phrase "teapot" being doubtless derived from that well-known passage in "The Winter Evening," that will live when this sneerer's rhymes are forgotten. I was better pleased to read in the "John Bull," that one of its correspondents, when turning over the volumes at a bookstall in the City Road, had lighted on an interesting relic of the poet Cowper—the copy of the Greek Testament that had been presented to him by the Rev. John Newton, of St. Mary Woolnoth, to whom so much of his correspondence was addressed, and to be near whom Cowper had gone to Olney. On the poet's death this volume came into the possession of Mr. John Johnson, that cousin who soothed Cowper's last moments with the tenderest care. Mr. Johnson presented the volume to a friend, at whose death it found its way into the bookstall box, from whence it was purchased for a few pence.

But more strongly still was Cowper brought "before my mind's eye" in that portrait numbered with three sevens, and exhibited during the past summer in the very interesting gallery of the National Portrait Exhibition. The masterly pencil and delicate grace of Romney were strongly evidenced in this picture; and what have been truly termed "the hare-like eyes of extreme sensibility and the tremulous features" of the gentle Christian poet were faithfully delineated. The portrait was in crayons: and if any objection could be made to it, it would be that the red tones of the face were somewhat too pronounced, increased in force by the contrast of the white skull-cap. The likeness of his mother, "Anne Donne, Mrs. Cowper," No. 778, hung next to that of her illustrious son. It was that very miniature which was presented to him by his cousin, Mrs. Bodham, and which led him to pen that poem, "Lines on the Receipt of my Mother's Picture out of Norfolk," which are surely some of the tenderest and truest ever written by a son of his mother. It was in February, 1790, that the welcome present was forwarded to him at Weston, and how dearly he prized it is recorded not only in his poem, but in his letters to the donor, and to his two other cousins, Lady Hesketh and Mr. John Johnson. "I had rather possess it," he writes, "than the richest jewel in the British crown, for I loved her with an affection that her death, fifty-two years since, has not in the least abated . . . I received it the night before last, and viewed it with a trepidation of nerves and spirits somewhat akin to what I should have felt had the dear original presented herself to my embraces. I kissed it and hung it where it is the last object that I see at night, and, of course, the first on which I open my eyes in the morning. She died when I completed my sixth year, yet I remember her well, and am an ocular witness of the great fidelity of the copy." The same testimony is paid in his poem, "Faithful Remembrances of One so Dear." It was two years after this that he addressed the sonnet "To George Romney, Esq.," on the painting of his portrait in crayons, of whose execution he very truly says,—

"I have never known
The artist shining with superior grace ;"

and then remarks on the pleased expression of the features, of which he neatly says,—

"The cause is clear ;
For in my looks what sorrow couldst thou see
When I was Hayley's guest and sat to thee?" *

* Portraits of Cowper were also painted by Jackson and Abbott. The former is in the collection of Earl Cowper, and a very good steel engraving from it is given as the frontispiece to "Cowper's Letters," published by the Religious Tract Society.

It was the year in which he formed the acquaintance of Hayley, and it was a year that was the beginning of sorrows, although he here wrote so sportively. These two pictures at the National Portrait Exhibition were unsurpassed by any in the building in their interest to men of letters, and must, during the past summer, have recalled to many thousands of visitors those pathetic lines that commence with the words, "Oh, that those lips had language!" and have brought them face to face with their delightful author.

There are one or two other recent matters in which we may also turn to Cowper—taking him as a commentator; for his remarks, written some eighty years ago, are quite pertinent to the subjects to which I allude. We country-folk in *Minima Parva*, who are (happily) removed from the roar of the great Babel, and can only take peeps at its doings through the loopholes of the press, often have to open eyes of wonder at the strange sights that those peeps set before us. There was, for example, that case of Madame Rachel, with her expensive methods to make silly women "beautiful for ever," by medicated baths, washes, and enamellings. One writer, in a learned publication, who referred to this notorious case, stated that "the practice of enamelling the face dated as far back as the time of Jezebel." But he overlooked the fact that the proud wife of Ahab is said to have "painted her face" (2 Kings ix. 30), and not to have enamelled it; and further, that the marginal reading shows that this painting was limited to the eyes, a practice that was also reproved by Ezekiel (xxiii. 40) in the cases of Aholah and Aholibah, and was the old Oriental custom of tinging the edges of the eyelids with a dark colour so as to increase their length and brilliancy. But face-painting, as we now understand the term, although practised before Elizabeth's time, mentioned by Shakespeare, and condemned by Philip Stubbs, would seem not to have been thoroughly established in this country until the lax beauties of Charles the Second's court introduced it from France, together with other fashions in costume which have again made their appearance during the past season. There is the false hair, for example, worn by ladies, similar to those artificial curls that were termed "heart-breakers," just two centuries ago; or like the "perukes," mentioned by Pepys when he wrote, "By-and-by comes La belle Pierce to see my wife, and to bring her a pair of perukes of hair, as the fashion is for ladies to wear;" and there are the long trains and the bared shoulders that were so strongly condemned in that "Just and Seasonable Reprehension" to which Richard Baxter wrote the preface. All these fashions have reappeared, together with face-painting, which continued to be much practised in the court of Anne, and is the subject of many remarks in the "Spectator," where the painted ladies are called *Picts*. It was still in vogue in the last quarter of the past century, when Cowper wrote, at much length, on the subject to his friend Mr. Unwin. His letter is dated May 3, 1784, and his remarks are so applicable to the practice of that art of which Madame Rachel would seem to be the most skilled (and expensive) exponent, that some extracts may be here made from them as bearing pertinently on the fashions of the present time.

"As to the immorality of the custom," says Cowper, "were I in France I should see none. On the contrary, it seems in that country to be a symptom of modest consciousness and a tacit confession of what we all know to be true, that French faces have neither red nor white of their own. This humble acknowledgment of a defect looks the more like a virtue, being found among a people not

remarkable for humility. Again, before we can prove the practice to be immoral, we must prove immorality in the design of those who use it; either that they intend a deception, or to kindle unlawful desires in the beholders. But the French ladies, so far as their purpose comes in question, must be acquitted of both these charges. Nobody supposes their colour to be natural for a moment, any more than if it were blue or green; and this unambiguous judgment of the matter is owing to two causes; first, to the universal knowledge we have that French women are naturally brown or yellow, with very few exceptions; and secondly, to the inartificial manner in which they paint, for they do not, as I am satisfactorily informed, even attempt an imitation of nature, but besmear themselves hastily and at a venture, anxious only to lay on enough. Where, therefore, there is no wanton intention nor a wish to deceive, I can discover no immorality. But in England (I am afraid) our painted ladies are not clearly entitled to the same apology. They even imitate nature with such exactness, that the whole public is sometimes divided into parties who litigate with great warmth the question, whether painted or not. This was remarkably the case with a Miss B., whom I well remember. Her roses and lilies were never discovered to be spurious till she attained an age that made the supposition of their being natural impossible. This anxiety 'to be not merely red and white,' which is all they aim at in France, but to be thought very beautiful, and much more beautiful than nature has made them, is a symptom not very favourable to the idea we would wish to entertain of the chastity, purity, and modesty of our countrywomen. That they are guilty of a design to deceive is certain; otherwise, why so much art? and if to deceive, wherefore and with what purpose? Certainly either to gratify vanity of the silliest kind; or, which is still more criminal, to decoy and inveigle and carry on more successfully the business of temptation."

He speaks of the use of rouge, white paint, and lotions, and shows, by examples, how their application must in time (as in the case of the beautiful Lady Coventry) be ruinous to the constitution. He excludes the French woman from his condemnation, considering that she painted her face with no more deceptive art than that used by an Indian squaw who painted blue and white circles on her cheeks; but in England he entirely disapproved of the practice. "I cannot indeed discover," he says, "that Scripture forbids it in so many words; but that anxious solicitude about the person which such an artifice betrays is, I am sure, contrary to the tenor and spirit of it throughout. Show me a woman with a painted face, and I will show you a woman whose heart is set on things of the earth, and not on things above." It is to be feared that these remarks on past fashions might be largely applied at the present time. Here, in *Minima Parva*, indeed, Madame Rachel's trade is unknown by familiar examples, and revealed to us only when we peep through the loopholes of the press. Our country belles are satisfied with the colours and complexions that Nature has bestowed upon them; their roses and lilies are of their own growth, and not produced by poisonous cosmetics; and, in short, the only painted ladies submitted to our gaze, and in which we can take a real pleasure, are those beautiful rosy apples, called "the painted ladies," of which this autumn has given us so bounteous a crop in our gardens and orchards—

"Hence Summer has her riches, Autumn hence,
And hence even Winter fills his withered hand
With blushing fruits, and plenty not his own."

But our apple-trees are now stripped of their pretty "painted ladies"; and the orchards have yielded their annual wealth of the fruit of that tree which was pronounced eight centuries ago by William of Malmesbury to be indigenous to Worcestershire soil, and which was so plentiful in Herefordshire, that Fuller quaintly said of that county:—"This shire better answereth to the name of Pomerania than the dukedom of Germany so called, being a continued orchard of apple-trees." The apple-month has gone by, and the month of fog and mist has once more come to the summit of "the rolling year."

Yet we are often unjust to November in accrediting it with so much fog, when far more frequently it is the month of calm autumnal days. Rather is it the month of the faded and falling leaf, when "the chesnut patters to the ground," when "the silvery gossamers twinkle into green and gold," and the calmness—

"Calm as to suit a calmer grief"—

the calmness of the waning year has settled upon the whole landscape. The poet Thomas Hood constructed a most ingenious ode to this month, founded on its negative qualities, in which the fog played the chief part. It began with these lines:—

"No sun, no moon,
No morn, no noon,
No dawn, no dusk, no proper time of day;
No sky, no earthly view,
No distance looking blue,
No road, no street, no t'other side of the way."

These lines were very aptly quoted by some well-read tramp, who headed them with the title "A Prison," and wrote them on the walls of the Newport Union. He had written other scraps of verse on the walls of other unions that he had patronised, and had signed them with the pseudonym "Bow Street." They were quoted two years ago in an article on "Our Tramp Wards and their Inmates," published in the "Spectator," the writer of which said of the above lines, "Would Hood himself have been ashamed either of the words or ideas?" They were in fact Hood's, and they are followed by others, with these to conclude the poem:—

"No warmth, no cheerfulness, no healthful care,
No comfortable feel in any member;
No shade, no shine, no butterflies, no bees,
No fruits, no flowers, no leaves, no birds,
No—vember!"

Yet, whether or no we are to have a monopoly of fog and mist in this November month, it will be hard to recall in it the great heat and drought of the previous summer; and it is highly probable that there will be not anything to remind us of the heat in which the last session of Parliament closed, on July 31st, except the heat of a general election and the broils of politics that this November has unavoidably brought upon us. It is curious to turn from this present month of elections to that in which the Parliament was prorogued. The London season had been hastened to its close by the intolerable heat, and the season and the session may be said to have been mutually dissolved by the influence of the tropical weather. On the 31st of July, the reformed Parliament had expired, at the age of thirty-six, and its successor is to be born this November, amid the throes of a general election, with new voters and new constituencies to wait upon its birth. Let us hope that it is destined to secure the advancement of the country in peace, prosperity, and religion.

The passing of "The Corrupt Practices Bill" at the close of the past session ought to make open and bare-faced bribery an impossibility, and sorely to puzzle the rats of voters how they can secure the tempting golden

bait without being caught in the legal trap. Yet the ingenuity of man may even devise expedients by which this seemingly insuperable difficulty may be successfully overcome. Cowper may be accepted as our present-day commentator even in this matter; and he blithesomely describes the visit of an electioneering candidate, who would appear to have established the system of osculatory bribes, where he could use no other system; and, doubtless, there were cases in which it was found to be (from Cowper's description of his appearance and manners) "metal more attractive" than gold and silver. It was in 1784, that notable period in the poet's life when he was writing "The Task," and about which period all his greatest poems were produced, that, being in the parlour at Olney with Mrs. Unwin and Lady Austen, a visitor was announced. Cowper's own description of the scene is too good to be abbreviated or given in other words than his own. "As when the sea is uncommonly agitated," he says, "the water finds its way into creeks and holes of rocks which in its calmer state it never reaches, in like manner the effect of these turbulent times is felt even at Orchardside, where in general we live as undisturbed by the political element as shrimps or cockles that have been accidentally deposited in some hollow beyond the watermark by the usual dashing of the waves. We were sitting yesterday after dinner, the two ladies and myself, very composedly, and without the least apprehension of any such intrusion in our snug parlour, one lady knitting, the other netting, and the gentleman winding worsted, when, to our unspeakable surprise, a mob appeared before the window; a smart rap was heard at the door, the boys hallooed, and the maid announced Mr. Grenville. Puss [his tame hare] was unfortunately let out of her box, so that the candidate, with all his good friends at his heels, was refused admittance at the grand entry, and referred to the back door as the only possible way of approach. Candidates are creatures not very susceptible of affronts, and would rather, I suppose, climb in at a window than be absolutely excluded. In a minute, the yard, the kitchen, and the parlour were filled. Mr. Grenville, advancing towards me, shook me by the hand, with a degree of cordiality that was extremely seducing. As soon as he and as many more as could find chairs were seated, he began to open the intent of his visit. I told him I had no vote, for which he readily gave me credit. I assured him I had no influence, which he was not equally inclined to believe, and the less, no doubt, because Mr. Ashburner, 'a shopkeeper at Olney,' addressing himself to me at this moment, informed me that I had a great deal. Supposing that I could not be possessed of such a treasure without knowing it, I ventured to confirm my first assertion by saying that if I had any I was utterly at a loss to imagine where it could be, or wherein it consisted. Thus ended the conference. Mr. Grenville squeezed me by the hand again, *kissed the ladies*, and withdrew. He kissed likewise the maid in the kitchen, and seemed, upon the whole, a most loving, kissing, and kind-hearted gentleman. He is very young, genteel, and handsome. He has a pair of very good eyes in his head, which, not being sufficient, as it should seem, for the many nice and difficult duties of a senator, he has a third also, which he wore suspended by a riband from his button-hole. The boys hallooed, the dogs barked, puss scampered, the hero, with his long train of obsequious followers, withdrew. We made ourselves very merry with the adventure, and in a short time settled into our former tranquillity, never, probably, to be thus interrupted more." There will be many, however, who will have

thus to be interrupted in the present month, and the foregoing scene, thus so vividly sketched by Cowper, will be re-enacted (with or without the kissing?) by many a candidate and his train of followers.

There is yet one other subject that I would mention in which we may accept Cowper as a commentator on this year's events. I refer to the great drought of the past summer. And, first of all, a word or two as to that remarkable season. The weather is the most ordinary topic of talk with all of us; but this summer it was unusually provocative of conversation and discussion. There were those two terrible days of great heat, Tuesday and Wednesday, July 21st and 22nd, when the reapers sank at their work, and fell smitten by sunstroke. There was also that other hot Wednesday, August 5th, the day on which the Queen left for Switzerland; when the harvest was well-nigh ended. That harvest was the earliest and most quickly gathered on record; reaping was done by moonlight; the corn was so dry that it could be carried as soon as cut; and was thrashed, and, in some places, made into bread before the first of August: whereas in the previous year the ingathering of the corn was so delayed that its shelter procured a prolongation for the lives of partridges far beyond their fatal 1st of September. To 1867 the caustic words of Horace Walpole might have been applied, "The summer has set in with its usual severity;" but in 1868 the severity was changed to that of heat, and we had more of the sun than is usually assigned to sunny June even by the poets. The pastures were dried up so much that here, in *Minima Parva*, the half-famished stock were turned into the fields that had been intended for hay, but whose grass did not pay for the expense of cutting. Haymaking was a country occupation that was chiefly made conspicuous by its absence: root-crops withered, and the demand for oil-cake and artificial food was so great that their price was raised. Sheep and oxen were sent to market and sold for an old song; and bread and meat were cheapened for a time. Brooks and ponds were dried up; the water-cart became a daily necessity, and had to go from field to field with its precious freightage to be placed in troughs for the panting cattle. The distress for pure water was everywhere great; and serious illness was caused in the fens and elsewhere from the polluted and stagnant water that had to be drunk. The green fields changed their hue to a dusky brown; the trees prematurely shed their leaves; laurels and shrubs perished; strawberries shrank to the size of blackberries; and the bright glories of the bedding-plants and riband-borders were sadly dimmed.

Mosquitoes, ranging northwards from the Woolwich marshes, acclimatised themselves in the heart of England. The volunteers, who had been half drowned at Wimbledon in 1867, were nearly burnt to death in their tents in 1868; carelessly dropped pipe-lights fired mountains and moors, parks and woods, and destroyed thousands of pounds' worth of property. Gangs of labourers were placed along railway embankments to prevent the fiery flakes from the railway engines (their chimneys not being protected as in America) from spreading devastation in the corn-fields on either side the line. Thatched cottages, photographers' studios, stacks and farmsteads, were converted by the heat into cases of spontaneous combustion. Yellow-checked old gentlemen declared that the sultriness was greater than they ever remembered in Calcutta; and people endeavoured to relieve their heated feelings by grumbling in the newspapers that our houses were not built for coolness, and that our streets were unprovided with shady avenues of trees. Others complained that our "customary

suits of solemn black" and our chimney-pot hats combined to form the most intolerably hot costume ever forced upon rational but perspiring creatures; and suggested that our clothes—which are termed "troublesome disguises" by Milton, whose authorship of a newly-found poem they discussed with a warmth akin to that of the weather*—should be exchanged for summer suits of alpaca, linen, or white flannel. Others declaimed against our slavery to conventionality and Mrs. Grundy in eating hot and heavy dinners, and in making our chief hours of business during the most sweltering part of the four-and-twenty hours. Umbrellas were put to the use implied in their Italian name, and gentlemen copied the example wisely set a hundred years ago by Jonas Hanway, whose Persian experience had taught him that the umbrella could be used as a sun-shade; even as Gay had before them (in 1712) written in his "Trivia,"—

"Let Persian dames the umbrella's ribs display,
To guard their beauties from the sunny ray;
Or sweating slaves support the shady load
When eastern monarchs show their state abroad.
Britain in winter only knows its aid
To guard from chilly showers the walking maid."

But the exceptional summer of 1868 saw the umbrella used by gentlemen as a sun-shade more generally than it had ever before been used for that purpose in the streets of English towns; and it was among the many striking features of that peculiar season. Even the first five days of August reached a temperature that was rather more than nine degrees hotter than had been attained at that period in the previous fifty years: but in the ensuing week there was a welcome change to rain.

Our cottagers at Minima Parva, who are wont to place implicit faith in the weather predictions of their penny almanacks, were, for once in their lives, shaken in their belief in "Old Moore." With every willingness to stretch a point in his favour, they were yet constrained to acknowledge that when their great authority said in some such words as these:—"You may expect rain on or about the 2nd, 5th, 7th, 12th, 14th, 18th, 21st, 25th, and 28th," and not a drop of rain fell from the 1st to the 31st, Old Moore had raised expectations that were doomed to be disappointed.† Nevertheless, despite such failures as this, the faith reposed in "Old Moore" by our rural population is something astounding. Mr. Charles Knight had noticed it (in his "Passages of a Working Life") in 1812; but it has even increased since that day with a ratio in excess of the proportionate increase of the population: It was stated that in 1867 nearly 700,000 copies of "Old Moore" were sold; and that with Partridge's, Raphael's, Orion's, Zadkiel's, and others, at least one million of "prophetic" annuals were disseminated. This present month of November will again witness their publication and their extravagant and wicked pretences to lift the veil that so mercifully shrouds the future from our view. To that future we may look hopefully forward, even though the retrospect of the past summer of high temperature and great drought may be attended with some sadness. Thus, though the wheat and barley harvest was so plentiful, yet the loss upon stock was said by Mr. Bailey Denton

to have been as great as from the cattle-plague; and this mainly from the long drought and the neglect in making efficient provision to store the winter rainfall.

But there is an old saying, "Drought never yet bred dearth in England"; and it was noticed that, in the year 1826, which most resembled the present year in its long continuance of heat and absence of rain, although the rain did not set in till September 18th, yet that the spring of grass after that time was so plentiful, that ample subsistence for flocks and herds lasted well into 1827 without drawing upon the diminished stores. And it was further said, that the quality of the stock in the country now is so much superior, and the general condition of it so much better than in 1826, that the animals can better bear up against their restricted food. In the "Times" for July 27, Mr. J. G. Symons gave a long and very elaborate statement of those years in the present century in which we had a temperature similar to that in the present year. These years were 1806, 1808, 1818, 1825, 1826, 1846, 1852, 1857, 1858, 1859. Mr. R. H. Allnatt, Mr. Steward, the Hon. and Rev. W. O. Forrester, and others, also contributed interesting records relating to the weather of those years. No mention, however, was made of the similar temperature and drought in 1788; and it is to that year I would particularly refer, as I have adduced Cowper as a commentator on recent events; and his observations on the long drought of 1788 will apply to the drought of 1868, and are such as may be profitably perused by all. "It has pleased God to give us rain, without which this part of our country at least must soon have become a desert. The meadows have been parched to a January brown, and we have foddered our cattle for some time as in the winter. The goodness and power of God are never, I believe, so universally acknowledged as at the end of a long drought. Man is naturally a self-sufficient animal, and in all concerns that seem to lie within the sphere of his own ability, thinks little or not at all of the need he always has of protection and furtherance from above. But he is sensible that the clouds will not assemble at his bidding; and that, though the clouds assemble, they will not fall in showers because he commands them. When, therefore, at last the blessing descends, you shall hear even in the streets the most irreligious and thoughtless with one voice exclaim, 'Thank God!'—confessing themselves indebted to his favour, and willing at least, so far as words go, to give him the glory. I can hardly doubt, therefore, that the earth is sometimes parched and the crops endangered, in order that the multitude may not want a memento to whom they owe them, nor absolutely forget the power on which all depend for all things."

May the lesson of the drought of 1868 have not been taught us in vain!

A LADY'S JOURNEY THROUGH SPAIN.

CHAPTER XII.

WE took up our quarters for the night at a most comfortable inn, called La Fonda de la Granja. At the village bearing that name, all the royal dependants resided when the court was at San Ildefonso. The temperature of this agreeable spot is most delightful—wholly free from the scorching heat of Madrid—and it enjoys all the bracing salubrity of air belonging to elevated regions in southern latitudes. It is nearly 2,000 feet above the level of the sea, and the palace is actually erected amongst the mountains. What a singular

* Cowper wrote a poem on "The late indecent liberties taken with the remains of Milton," which Lord Winchelsea might have paraphrased in this controversy.

† "Zadkiel," another of these traders on popular credulity, was equally unfortunate in his predictions. For July, he particularised several days on which there would be "misty drizzling rain" or "violent thunderstorms all through the land," summing up the meteorology of dry, sultry July, with the italicised words, "*Much rain this month!*"

fancy, shared by so many Spanish and Moorish sovereigns—that love of building their royal dwellings on hills or rocky heights! The Alhambra, the Generalife, the Escorial, San Ildefonso, and other buildings I could name, all stand very high, on pinnacles, as it were. The situation is truly picturesque. One is in the midst of fine mountain scenery: the most magnificent forests extend all around; fresh clear streams foam and sparkle in the sunshine; and above all the glorious mountain La Peñalara raises its stately head to the height of nearly 9,000 feet above the sea level. The former name of the site on which the palace was built was La Granja, literally grange or farm buildings, and the spot was purchased by Philip v, as there he thought he might live in retirement suited to his singular habits. Talk of contrasts! where could we find one greater than that between this thoroughly French chateau or palace, in the midst of scenes of great natural beauty, and that grand yet most gloomy Escorial?

San Ildefonso is almost theatrical in its display of ornaments, both exterior and interior; but we passed hastily through the palace, reserving all our energies for the gardens, which are almost unrivalled in Europe. Equalled they may be by some, but surpassed by none that I have either seen or heard of. They may well be beautiful, for the cost of their formation was something fabulous, even in those days when no sum was thought too extravagant to be lavished on royal pleasures and pursuits. The mountainous country surrounding these gardens, while it adds greatly to the beauty of the scene, also added to the cost. The waterfalls are very lovely: the brilliant clear mountain streams are caused to fall in one magnificent sheet of water transparent as crystal, and glowing in the light of the southern sun like molten silver. Trees, flowers, shrubs, and velvet turf abound; and it is very striking to see this highly kept and ornamented parterre, one glowing mass of colours, situated high up in the midst of mountainous scenery, with fine rocks and hills and stately fir-trees enclosing it as in a frame. We were possessed of a private order for the fountains and cascades to be made to play, and this display added greatly to the charms of the scene.

As we descended from the hills down again into the plains, we were greatly struck by the fine old city of Segovia. We determined to give one whole day to this most interesting specimen of an old Castilian city, for we had been warned that it would be a great mistake if we neglected visiting it. Accordingly, instead of returning to Madrid from La Granja, we went on to Segovia, and took up our abode for the night at the very much improved inn in the town. The city is situated on a rocky ridge at a considerable elevation above the plain, and two streams almost surround the hill. Its picturesque old walls, the alcazar, the curious round towers, the singular houses with their balconies, and the artistic effect of the buildings grouped together upon the rocky eminence on which the city stands, form a scene an artist would delight to gaze at. We were charmed, though the sharp keen air blew so chill in our faces that, accustomed as we had been for so many months to the luxurious warmth of those southern lands, we almost shivered at the change. Still the sun shone bright, and after we had descended to more sheltered regions, we no longer complained of the wind. Segovia is one of the most ancient cities in Spain: its antiquity, or rather that claimed for it by its citizens, carries us back to ages so remote that we may soon get lost in the mazes of antiquarian lore. Its ancient aqueduct is one of those grand works completed in those days with such magnificent results. For more than

three leagues does this splendid structure convey the pure water to the city. The central arches are upwards of one hundred feet in height, and nothing can be more picturesque than the view of these tiers of beautiful arches rising one above the other.

The cathedral is a noble building, certainly one of the finest in Spain. The colour of the stone used in the erection is most effective. The view from the summit of the tower well repays one for the exertion of the ascent, so fine is the panorama of mountains, woods, streams, gardens, and the striking city itself. We visited the alcazar chiefly, I think, because within its walls that admirable writer Le Sage represents his hero Gil Blas to have been confined.

Segovia formerly was famous for the beautiful merino wool of the sheep pastured in the vicinity. Most curious accounts are given in the old chronicles of the enormous flocks that were kept by the different convents, as well as by other proprietors. The time of sheep-shearing was made a regular festival, and all the people came from the different villages and hamlets in the neighbourhood to take part in the festivities. The flocks were immense, and it required no small amount of labour to shear such large numbers of sheep, but it was all done with admirable method and skill. There was so much rivalry in the wool trade in those days, that the spirit of emulation kept all concerned on the alert. It is very different at the present time: the wool trade has shared the fate of all other Spanish manufactures; the same dull stagnation pervades it that has been so fatal in other things. Within the last few years (so we were told by those who have the welfare of Spain deeply at heart) there has been a decided reaction; and the iron roads that are beginning to traverse the country in many directions must in process of time introduce a new order of affairs. Many of my readers may have seen specimens of this beautifully fine merino wool in the fairy-like knitting for which some of the towns in the Pyrenees are celebrated. But I must not loiter, but go on my way.

Who could be in Spain—nay, at Madrid—and not visit Toledo, one of the most remarkable of the Spanish towns, and formerly the splendid capital of the monarchy under the Gothic rule? I can only say, it is to be hoped that in the palmy days of its celebrity the different roads that led to it may have been less detestable than they are at the present day.

We were much struck on our nearer approach to the town by the remarkable air of antiquity that pervaded it. Toledo is placed on numerous hills, something after the manner of Rome; it was even stated in the old account that their number was the magic one of seven. Whatever their number really may be, they are of considerable elevation. The picturesque river Tagus circles them with a bright and shining girdle. The streets are steep and narrow; but the houses have an air of massive grandeur that tells of bygone splendour, of dwellings erected not merely for the passing requirements of an increasing population, but with a due regard to posterity; so that a family mansion was an heirloom, and was passed on from generation to generation almost uninjured, and if altered only improved by the embellishing hand of time. Many houses in Toledo are very Moorish in aspect, as they well may be, for the town was under the dominion of the Moors for some centuries.

For a Spanish town, Toledo is one of the cleanest that we saw. The reason of this superiority may be found in the ample supply of water that is ever at the command of the Toledans. The Tagus is an ever-flowing

and most bountiful stream. The character of the Tolodans is very much in accordance with the country they occupy. They are solemn and grave in aspect, slow and dignified in their movements, brave, and faithful, and honest. There are many really excellent traits in

both the other races in almost every attribute. So richly do these different remains adorn this singular old town that it may well be called "charmed ground." Not a sound of a carriage or vehicle of any sort disturbed our silent reveries, for few wheeled conveyances could

ROMAN AQUEDUCT AT SEGOVIA.

their character, and the higher classes speak their fine language with a purity of accent and clearness of utterance delightful to hear.

Toledo teems with memories of the past. In that respect it is far more interesting than Madrid. At Toledo every street is a picture. One knows not which most to admire, the Roman remains—relics of that wonderful people who never planted their proud eagles in any country without leaving lasting traces of their presence—or the works of the poetic, romantic, chivalrous, and pleasure-loving Moors; or again, the grand stately buildings of the sterner Goths, widely differing from

pass along those steep, ancient-looking streets. The whole aspect of the place is stately and solemn in the extreme. How beautiful is the splendid Moorish gateway of rich harmonious red brick! Then how truly picturesque is the mass of varied buildings, convents, palaces, and churches, all heaped together on the rising ground, the rocky pinnacles standing out in fine contrast from the ancient ruins.

It is pleasant to stand on the Moorish bridge which traverses the Tagus, and gaze at the impetuous river, as its waters pour forth from the narrow gorge above. In the immediate vicinity of the town may be found

spots of such wild and rugged aspect, that truly one might imagine oneself many a long mile away from the noisy haunts of men. There are many such to be found along the banks of the Tagus, and had I spent weeks instead of days at Toledo, I should never have wearied of exploring them. More especially attractive were they at the season when I saw them. The Tagus is still said "to run over golden sands," and many an anxious watcher may be seen patiently at work sifting and straining, and washing the precious deposit, for the narrow chances of finding even an infinitesimal quantity of the valuable metal. This river is remarkable, inasmuch as though formed to be a main artery of the country through which it runs, it has always remained a solitary and lonely river, as far as the tide of human life is concerned. No steamers, scarcely any boats, are seen on its waters. But though in one sense it may be called a lonely river, yet have its banks many tales to tell—of battles, of skirmishes, of sieges, of lonely dungeons built on rocky pinnacles overlooking its waters, of imprisoned ladies gazing on the rushing current week after week, of rescuing knights crossing from one precipitous bank to the other, of awful struggles for empire taking place within sight and sound of its waters. Many-coloured rocks seem at some points entirely to close it in, in a narrow gorge or basin; but some sudden turn reveals fresh beauties of wild rocky glades, overhanging precipices, rushing waterfalls, and smiling valleys. The Toledan laundresses have chosen a lovely spot as the scene of their labours, and their gay attire, their merry songs, their pleasant manner to strangers who try to make acquaintance with them, are all most harmoniously in unison with the scene.

Any one paying their first visit to this ancient town should by no means omit going at sunset to see the painted windows in the cathedral. Beautiful at all times, at that hour they glow with the beams of the setting sun, till they appear like a gorgeous mass of precious stones. They were all painted by famous foreign artists, and the price stated to have been given for each single window seems almost incredible. Many of the internal decorations of the cathedral are exquisitely beautiful; and greatly as I dislike gilding generally in a church, there are two pulpits of metal richly gilded, that are as exquisite in their workmanship as the finest specimens of gold plate. The image of the Virgin in the cathedral at Toledo is perfectly black, and the estimation in which she is held is plainly shown by the lavish adornments with which she is literally covered. She is seated on a massive silver throne gorgeously carved. The canopy is also of solid silver. The jewels in her crown would form a dowry for an empress, and the precious stones set in various articles for her adorning are more valuable than many crown jewels. The churches are very numerous in Toledo, but as there is a great sameness in Spanish churches, I refrain from detailed description. If I were asked what I cared least for amongst the varied and interesting sights that occupied my time during my stay in Spain, I should say the Churches. Of course I speak generally, and I except the grand Cathedrals of Seville, Gerona, and a few others, not surpassed elsewhere in Europe.

There is one thing for which Toledo has been renowned from the earliest days, which must claim a passing notice—I allude to the manufacture of sword-blades—and their celebrity has in no degree decreased. There are many curious laws and regulations in old archives, respecting the profession of armoury as practised formerly in this town, and it required very strict examinations before any one was admitted a member of the body of

armourers, or corporation, as it was termed. These famous sword-blades, especially, were supposed to derive somewhat of their temper and excellence from some properties of the water of the Tagus, which was exclusively used in the process. Before the invention of gunpowder, the manufacturers of these renowned blades made large fortunes from the enormous demand for them. Even at the present day the trade in them still continues, and nothing can be more picturesque than the establishments where it is carried on. The costume of the men employed adds to the artistic effect of the scene; and I often paused, attracted by the clear, regular cadences of the hammers falling on the iron, and watched the work and the dexterity of the workmen in all the branches of their trade. These workshops are on the right bank of the river, and the extraordinary fine temper and elasticity of the swords is still so great, that, according to the manufacturers, they are sometimes packed up in a similar manner to the fine steel springs of a watch, without receiving the slightest damage. The three trials that these swords were formerly made to undergo were very curious. The first was made by resting the blade on a kind of iron horse and bending it down by great pressure with one hand on each side of the horse; this trial was often repeated, and at the end of them the blade was to appear perfectly straight without any blemish being visible. The next was known as that of "the lion's tongue." A leaden imitation of a lion's tongue was fastened to the wall, the point of the sword was placed against the tongue, and the weapon gradually bent till it was nearly in a semicircle. If there was any flaw it would shiver like glass under this trial; if there was no blemish it would instantaneously resume its original form. The third was the most formidable. A block of iron was placed on a cushion stuffed with hay, and then the farrier, with the whole strength of his arm, was to give a furious cutting blow at the iron. The blade was to pass through the trial without even the minutest notch in its edge. Blades having passed through all three trials successfully were in the proportion only of twelve per cent., a wonderfully small number when one reflects that those that failed were condemned as old iron. The trade has lately revived considerably, so we were informed at the principal establishment.

THE MIDNIGHT SKY AT LONDON.

NOVEMBER.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

WE have alluded in preceding months to the term "fixed," as an epithet given to distinguish the great majority of stars from the sun, moon, and planets, whose apparent positions in the heavens are continually changing sensibly from day to day, and, in the case of the moon, from hour to hour. The so-called fixed stars, so far as can be measured by the unassisted eye, however, never alter their relative positions with respect to each other, and appear as if they were attached to the celestial sphere. They are observed to rise in the east and set in the west, from day to day, and from year to year, without any sensible change in their general aspect, excepting only that due to the seasonal variation of the earth's position in her orbit, as briefly explained in March. This apparent absolute fixity of the stars in space was supposed by the ancients to be real, and it was not till the year 1717 that Dr. Halley, owing to the greater accuracy of modern astronomical observations,

noticed that the positions of the three bright stars, Sirius, Aldebaran, and Arcturus, were from one-third to half a degree more southerly than those recorded by Ptolemy on the authority of some observations of these stars made by Hipparchus, 130 B.C. At first it was naturally supposed that the discrepancy arose from errors in the observations of the ancient astronomer, but Dr. Halley considered that the observed differences between the ancient and modern positions of these three stars were more likely caused by a peculiar motion of the stars themselves. This explanation or opinion of Dr. Halley has been completely confirmed by the more precise observations of the present century. In truth, it has been found for a certainty, that a very large number of stars have their own "proper motion," some of greater extent than others. The right ascension and declination of upwards of 3,000 stars, observed by Dr. Bradley between 1750 and 1762, have been compared with modern observations of the same stars, and the annual proper motion of each accurately determined. In a few stars these peculiar displacements reach to a very sensible amount, the largest being nearly eight seconds of arc annually. In the binary star 61 Cygni (see page 507) this proper motion consists of rather more than five seconds, and it is found that the two stars composing the binary system have the same amount of annual displacement. This equal angular motion is a convincing proof of their physical connection, independently of their revolution around each other.

The subject of the proper motions of the "fixed stars" has been in many ways extremely interesting to astronomers, as it is by the systematic discussion of these apparently small quantities, that the existence of a supposed motion of the solar system in space has been determined. Sir William Herschel, in 1783, was the first who drew the attention of other astronomers to the probable existence of this proper motion of the solar system. His research led him to point out Lambda Herculis as the direction towards which the sun was moving. One argument in favour of the problem, and a very strong one it is, is that successive astronomers with different data have, without exception, found the solar motion directed towards the same point in the heavens. A recent investigation by the Astronomer Royal has, however, thrown some doubts on the reality of this rather romantic astronomical problem, or at all events on some of the received notions respecting it. A more extensive inquiry made in 1863 by the author of these papers, by applying Mr. Airy's formulæ to the proper motions of 1,167 stars, confirmed the doubts resulting from the previous research, although the direction of solar motion agreed with that found by Sir William Herschel, and the velocity with that determined by M. Otto Struve. But although the apparent movement of the sun in space does not appear to account for much of the star displacements, as exhibited by the researches of the Astronomer Royal and the writer, yet so distinguished an astronomer as Sir John Herschel has remarked that it is not surprising that such should be the case, and that it could not be expected that any movement assigned to the sun would account for more than a very small portion of the observed proper motions. He says:—"But what is indeed astonishing in the whole affair is, that, among all this chaotic heap of miscellaneous movement, among all this drift of cosmical atoms, of the laws of whose motions we know absolutely nothing, it should be possible to place the finger on one small portion of the sum total, to all appearance undistinguishably mixed up with the rest, and to declare with full assurance that this particular portion of the whole

is due to the proper motion of our own system." A suggestion has been given by Dr. Mädler that the solar system is quietly revolving around Alcyone, the brightest star in the Pleiades, as the central sun. This idea of Dr. Mädler is not conclusively accepted by other astronomers, and the subject of a central sun is therefore only considered as a problem belonging to speculative astronomy, which will require many centuries to elapse before sufficient data can be obtained to speak positively on the question.

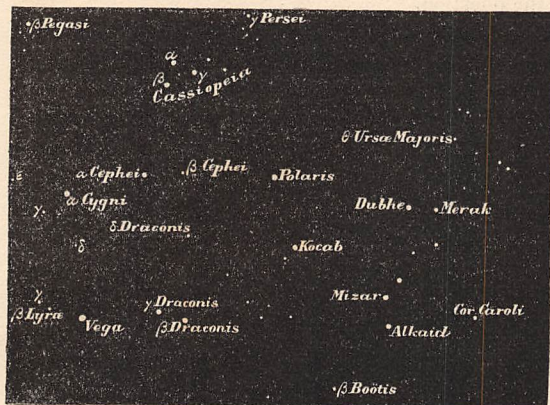

The midnight sky in the middle of November contains a large instalment of bright winter stars, with which we are so familiar in the evenings of the first months of each year. In the lower diagram, many of these can probably be identified by the reader at a glance, or by a reference to the corresponding index-map. The zenith is now occupied by the constellation Perseus, the chief star of which, Alpha Persei, is very near that point, slightly west of the meridian. Algol is a little lower towards the S.S.W. Looking due west, below Perseus, the eye passes over Andromeda and Pegasus, in which the four stars in the square of Pegasus may be recognised. Of these, Alpherat, or Alpha Andromedæ, and Gamma Pegasi, may be noticed in the right-hand upper corner of the diagram. If we look in a south-westerly direction, below the two bright stars in Perseus, the next conspicuous objects are Alpha and Beta Arietis; and lower down, nearly to the horizon, most of the visible stars are included in the constellation Cetus. Jupiter still shines in Pisces, above all other objects on this side of the meridian.

The Pleiades are now on the meridian, about twenty-eight degrees from the zenith; these popular stars can always be distinguished without difficulty, by their nebulous or cloudy appearance to the naked eye. The central and principal star of the group, Alcyone, is about the third magnitude. At this moment only three constellations are on the meridian, Perseus, Taurus, and Eridanus. The last is a very extensive asterism, and many modern unsuccessful attempts have been made to reduce it by the formation of several small constellations out of some of its outlying portions. The stars near the meridian, in the lower portion of the diagram, all belong to Eridanus; none of them are, however, greater than the third magnitude. Achernar, of the first magnitude, is not only the principal star in Eridanus, but also one of the brightest in the southern hemisphere. It never rises, however, above the horizon of London.

Let us now direct our attention to the sky east and south-east of the meridian. Here we have at one view a perfect galaxy of stars, including those in Taurus, Auriga, and, lower down half-way between the zenith and the eastern horizon, Castor and Pollux. These stars can be recognised near the upper boundary line on the left-hand side of the lower diagram. Near the horizon, but outside our limit, Regulus and the stars in Leo, including the planet Mars, add to the beauty of the eastern midnight sky of this month. From the meridian to the E.S.E. horizon, we pass above Orion and through Taurus, Gemini, Canis Minor, and Hydra, and near the first-class stars Aldebaran and its companions the Hyades, Beta Tauri, and Procyon. The position of Orion in the heavens requires no explanation, as that is always pointed out by the well-known three stars in the warrior's belt. The two upper stars are Betelgeuse in the north-east, and Bellatrix in the north-west corner of the quadrilateral, Rigel being in the south-west corner. Sirius, the brightest of the fixed stars, is near the horizon in the south-east. A tolerably bright star to the

right of Sirius is Beta Canis Majoris. A few objects below the quadrilateral of Orion belong to Lepus. Between Sirius and Procyon, the sky is occupied by Monoceros, a district void of stars above the fifth magnitude. Near the horizon in the S.S.E., one or two objects below Sirius in Canis Major, and in Columba, can be seen at midnight.

Aries, the Ram, is the first in order of the ancient

INDEX-MAP, LOOKING NORTH, NOVEMBER 15.

zodiacal signs, and is consequently one of the forty-eight asterisms of the ancients. As we noticed last month, although this constellation is the first, or leading sign, in the zodiac of Hipparchus, by reason of the sun formerly entering Aries on the 20th of March, it is now no longer so, as by the precession of the equinoxes, the first point of Aries of Hipparchus has passed thirty degrees east of the point where the sun now crosses the equator from south to north at the vernal equinox. Aries has Triangulum on the north, Taurus on the east, Cetus on the south, and Pisces on the west. About twenty stars in Aries were known to the ancients, eighteen

INDEX-MAP, LOOKING SOUTH, NOVEMBER 15.

having been catalogued by Ptolemy. Bode's Atlas contains one hundred and forty-eight. The principal stars are Alpha and Beta Arietis, both situated in the head of the Ram. Aries, and the neighbouring small constellation Triangulum, contain several interesting double and triple stars. The position of Aries may be gathered from our previous remarks, and by an inspection of the lower diagram, in which the two principal stars are placed about midway between the Pleiades and Gamma Pegasi.

Cetus, the Whale, occupies a considerable portion of the south-western sky at midnight in November. It is south of Aries and Pisces, west of Eridanus, Orion, and Taurus, east of Aquarius, and north of Sculptor and other small constellations. Cetus is very extensive, and is one of the old standard forty-eight asterisms. It contains three hundred stars of sufficient magnitude to be included in Bode's Atlas. Alpha Ceti, or Menkar, and Beta Ceti, or Diphda, are the principal stars. They are, however, widely separated, Menkar being near the eastern portion of the constellation, and Diphda the western. The index-map will point out the relative positions of these objects, but, by star-alignment, a line drawn from Pollux to Aldebaran, and then carried forward nearly as far again, will pass close to Menkar, in the head of the Whale. Or, according to the rhymster:—

"To know the bright star in the Whale,
The lower jaw which decks;
From fair Capella send a glance
Through Pleiad's beauteous specks;
And bear in mind this cluster fine,
So admirably seen,
From Cetus' head to th' Charioteer,
Lies just half-way between."

A very remarkable variable star is to be found in this constellation, known by the name of Mira Ceti. The variation in lustre of this star was first noticed by David Fabricius, in 1596. It retains its maximum brightness during fourteen days, and is then of the second magnitude. Its light afterwards gradually decreases for about three months, when it becomes not only invisible to the naked eye, but also when looked for with the largest telescopes. It remains invisible during five months, then reappears as a minute telescopic object, and afterwards increases gradually for three months, when it again attains its maximum splendour. The time of its period from maximum to maximum is about 331 days. The greatest lustre of this curious star has been found to be not always the same; it is usually equal to the second magnitude, but, occasionally, it has been recorded that at its maximum it has appeared only of the fourth magnitude. In 1799, according to Humboldt, its light shone with an intensity nearly equal to that of stars of the first class, in fact scarcely inferior to Aldebaran. This object is one of the most interesting of the variable stars, as may be inferred from the appellation by which it is distinguished, Mira, or the wonderful star.

In addition to the usual circumpolar constellations, the northern sky contains, at midnight, portions of Pegasus, Cygnus, Andromeda, Vulpecula, Lyra, Hercules, Boötes, Canes Venatici, Coma Berenices, Lynx, Leo Minor, and Leo. We will now compare the upper diagram with the sky north of the zenith. Taking the north-western quadrant first, the bright star-group of Cassiopeia will be the first to attract our notice. Below Cassiopeia, in a north-westerly direction, the three principal stars in Cepheus may be recognised as forming an arc of a circle, of which Beta, the lowest of the stars in Cassiopeia, is nearly the centre. Between Cepheus and the horizon, the sky is occupied by Cygnus, whose chief star Deneb, or Alpha Cygni, is a prominent object twenty-five degrees high. Vega is near the horizon in the N.N.W. The two bright stars between Vega and the meridian, are Gamma and Beta Draconis, Gamma being that nearest to Vega. Draco now incloses Ursa Minor on the west, north, and east. Kocab, Gamma Ursæ Minoris, and the small stars leading to Polaris, are all to the north of the pole. A considerable portion

E

THE MIDNIGHT SKY AT LONDON, LOOKING NORTH, NOVEMBER 15.

E

W

THE MIDNIGHT SKY AT LONDON, LOOKING SOUTH, NOVEMBER 15.

of the north-east sky is occupied by Ursa Major, which extends some distance south and east of Charles's Wain. The pointers, Dubhe and Merak, are the uppermost stars of the group, the third is Gamma Ursæ Majoris, the fourth Delta, the fifth Epsilon or Alioth, the sixth Zeta or Mizar, which is double, and the seventh Eta, or, as it is sometimes called, Alkaid, or Benetnasch. This last star is fourteen degrees above the horizon. The companion star of Mizar is named Alcor, and can be perceived occasionally by the naked eye, and very clearly with an opera-glass, or small hand-telescope. South of Ursa Major and Draco, the large space reaching to the zenith is chiefly occupied by Lynx and Camelopardus, two constellations without a single large star. In the eastern horizon, but outside the limit of the diagram, several bright stars in Leo have just risen, amongst which the planet Mars is a brilliant object. The actual horizon from west to north and east is occupied by Pegasus, Vulpecula, Cygnus, Lyra, and Hercules, west of the meridian, and Boötes, Canes Venatici, Coma Berenices, and Leo, east of the meridian.

Mars is now becoming a conspicuous object in the heavens; we therefore take this opportunity of giving a few brief particulars of his position in the solar system, and of the telescopic appearance of his surface. Mars is the fourth planet from the sun, being the next in order to the earth. His surface exhibits a greater analogy to that of our own globe than any other planet of the solar system, and when he is at his least distance from us, he shines with great splendour in the midnight sky. He can always be distinguished from the other planets, and from the fixed stars, by his ruddy light. Owing to his occasional near approach to our earth, great facilities are obtained for delineating the various lights and shades on his disk; and at such opportunities numerous accurate drawings are always made. When viewed through large telescopes, the surface of Mars represents the outline of continents and seas, and near the poles white spots are clearly visible, which owe their existence probably to an accumulation of snow in the polar regions.

The mean distance of Mars from the sun is one hundred and forty millions of miles, and his nearest distance from the earth averages forty-eight millions. The equatorial diameter of Mars is about 4,363 miles, and his polar diameter about seventy miles less. He revolves around the sun in a few minutes less than 687 days. When in or near opposition the form of Mars is sensibly globular, but in other portions of his orbit he is generally seen gibbous, similar to our moon between the first or last quarters and the full. The time of revolution of Mars on his axis has been determined to be twenty-four hours, thirty-seven minutes, and twenty-three seconds.

The apparent magnitude of Mars is very variable in consequence of the elliptical nature of his orbit. When on the opposite side of the sun with respect to the earth, and therefore at his greatest distance from us, his telescopic diameter amounts to less than four seconds of arc, but at the times of his nearest approach at favourable oppositions, his telescopic diameter is increased to twenty-four seconds of arc. When viewed on these occasions with a good telescope, his disk appears covered with various markings of a very distinct character, some of which give those defined appearances of continents and seas which have been so ably depicted by so many astronomers. The brightest parts, excepting the white patches near the pole, have a ruddy tint, while the darker portions have a greenish hue, the effect probably of contrast. It is by the

observation, at different epochs, of the positions of these fixed markings on the disk of Mars, that the most accurate determinations of his rotation have been made. One very recently published by Mr. Proctor, from comparisons of the modern delineations of Mars with some made by Hooke in 1666, gives a result, which is probably true to the hundredth part of a second.

If there be any inhabitants on Venus, the surface of the earth will appear to them very similar to that of Mars in our telescopic views of that planet. They will, however, have the advantage of seeing a globe of larger dimensions, but the general aspect of the terrestrial surface, including the distribution of land and water, will be the same. The poles of the earth would probably appear comparatively bright, as in Mars, if it be true that our unexplored polar regions are covered with ice and snow. Although the atmosphere of Mars is not considered to be so dense as was formerly attributed to him, yet it is proved that, like the earth, he is surrounded by one of sufficient density to obscure occasionally the various markings on his surface, particularly those near the edge of the planet, when many of the darker spots are quite effaced. Mars is doubtless subject to similar meteorological phenomena as our earth, and perhaps to greater sudden changes of weather. Professor Phillips, of Oxford, has remarked that the great interchange of the humidity of the atmosphere which must necessarily take place periodically between the two hemispheres, and especially between the two poles, would give rise to very violent hurricanes, of which we have little conception. The difference in the lengths of the years of the earth and Mars is one point where the analogy between the two planets fails, for as the Martian year is nearly twice as long as that of the earth, the seasons on Mars will be lengthened in a corresponding proportion.

Mars is the only large planet, exterior to the earth, without a satellite. Being at a greater distance from the sun than our globe, one would suppose that there would be a greater necessity for an attendant moon than with us, but no telescopic aid has been able to detect any object near the planet. If, however, a very small moon were situated comparatively near to the surface of Mars, our present optical means would probably not be sufficiently powerful to perceive it. In the absence of a satellite, the nights of Mars must be always obscured, relieved only by occasional auroral displays, or by the morning and evening twilight before and after the sun is above the horizon. The mass of Mars is only one-eighth part of that of the earth. His orbital velocity, or motion in space around the sun, is 53,088 miles per hour, and the velocity of his rotation at the equator is 558 miles per hour.

Until recent years the ruddy tint of Mars was universally believed to owe its origin to an unusually dense atmosphere, but this opinion has been considerably modified since the surface of the planet has been so carefully scrutinised by Professor Phillips, Mr. De La Rue, Mr. Lockyer, Mr. Huggins, and others. It has been found that the light reflected from the neighbourhood of the poles has no trace of colour, although in its course it has passed through a denser atmosphere than that which is found on the central portions of the disk, where the ruddy tint is most apparent. Mr. Huggins, who has made some very important observations of the spectrum of the solar light reflected from Mars, remarks that "if indeed the colour be produced by the planet's atmosphere, it must be referred to peculiar conditions of it which exist only in connection with particular portions

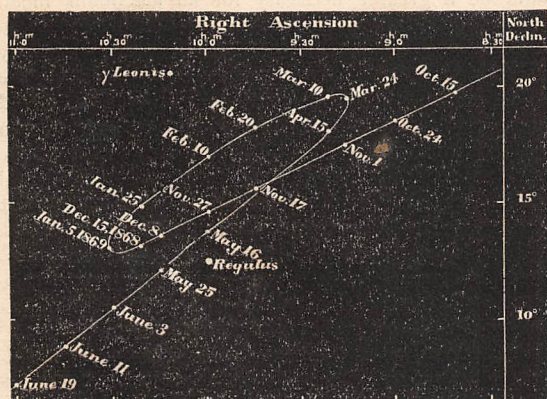

of the planetary surface. The evidence we possess at present appears to support the opinion that the planet's distinctive colour has its origin in the material of which some parts of its surface are composed. Mr. Lockyer's observation, that the colour is most intense when the planet's atmosphere is free from clouds, obviously admits of an interpretation in accordance with this view."

POSITION OF MARS AT MIDNIGHT, NOVEMBER 15.

Mars is not only an interesting telescopic object, but when he is at his least distance from the earth, corresponding observations of his exact position in declination are made at various stations situated in the northern and southern hemispheres, for the determination, by an indirect method, of what is technically called "the constant of solar parallax." It is by the knowledge of the value of this astronomical constant that the distance of the sun from the earth in miles is deduced.

The proximity of Mars to the earth in 1862 was a favourable opportunity for this purpose, when, by pre-

APPARENT PATH OF MARS.

vious arrangement, corresponding observations were made at Greenwich, Pulkowa, Washington, and Albany, in the northern hemisphere, and at the Cape of Good Hope, Williamstown near Melbourne, and Santiago, Chili, in the southern hemisphere. The observations were independently discussed by Mr. Stone and Dr. Winnecke, whose results agreed so closely with those previously determined by M. Hansen and M. Le Verrier from the lunar and planetary theories, that our leading astronomers have not hesitated to accept the new value in preference to that found from the transit of Venus in

1769, although the effect has been to reduce the absolute distance of the sun from the earth from ninety-five and a quarter millions to about ninety-two millions of miles.

The appearance of the sky at midnight, as represented by the November diagrams, will be the same at different hours in other months of the year. The diagrams will therefore serve for comparison with the heavens at 4 A.M. on September 15; at 2 A.M. on October 15; at 10 P.M. on December 15; at 8 P.M. on January 15; and at 6 P.M. on February 15.

In November, 1863, Venus, Mars, and Jupiter are all conspicuous planets at different hours of the night. On the first and following days of the month, the moon will be in Taurus, being near Aldebaran and the Hyades on the 2nd. On the morning of the 8th, she will be between Mars and Regulus, and on the 11th near Venus. She will not be far from Jupiter on the evening of the 24th, remaining together till they set in the west. On the 30th, Aldebaran, for a second time this month, will be near the moon, which will in the interval have passed through all the zodiacal signs in succession. She is in perigee, or at her least distance from the earth, on the 9th, at 2 P.M., and in apogee, or greatest distance, on the 22nd, at 2 A.M. The days and hours at which the principal phases of the moon occur are as follows:—Last quarter on the 7th, at 1.47 P.M.; new moon on the 14th, at 10.56 A.M.; first quarter on the 22nd, at 6.47 A.M.; and full moon on the 30th, at 1.0 A.M.

Mercury will be visible to the naked eye low down in the south-east shortly before sunrise, from the middle to the end of the month. He rises about two hours before the sun on the 21st. Mercury passes exactly between the earth and sun, or in inferior conjunction, on the morning of the 5th, when an opportunity will be had of witnessing the most interesting phenomenon of his transit, from east to west, across the solar disk. Unfortunately the sun will be below the horizon when the first apparent contact of the sun and planet takes place, consequently the transit will only be partially visible in this country. At sunrise, at 7.3 A.M., Mercury will appear near the centre of the sun, after which the planet will be seen to approach gradually the western edge of the sun, where it will disappear in the solar rays at 9.3 A.M. If the sky near the south-eastern horizon be quite free from cloud, the planet will be seen as a densely-black round spot. To observe it, it will be necessary to protect the eye by a deeply-coloured glass placed before the eyepiece of an ordinary telescope or good opera-glass. On the eastern coast of Africa, near Madagascar, and along the Indian Ocean nearly as far as Australia, the sun will be near the zenith during the progress of the phenomenon.

Venus is still a brilliant morning star, rising on the 1st at 2.47 A.M., and on the 30th at 4.6 A.M., almost due east. Mars rises about an hour and a half before midnight, and is gradually increasing in lustre. The two planets, Venus and Mars, add considerably to the beauty of the morning sky. Jupiter, the evening star of this month, reaches his greatest altitude on the south meridian at 9.37 P.M. on the 1st, and at 7.38 P.M. on the 30th. He sets in the west at 2.44 A.M. in the middle of November. Saturn is not favourably situated, being too near the sun to be observed even with a telescope. Uranus and Neptune are in favourable positions, but it is necessary that the observer should have a fixed instrument, furnished with a graduated setting-circle, to be able to detect such minute objects. In the field of view of a telescope Uranus can always be distinguished from the fixed stars by its very sensible disk.

HANS AND BARBARA VISIT THE PRIEST.

THE EXILES OF SALZBURG.

CHAPTER X.

"Is the reverend father at home?" inquired a young man, not long afterwards, of the plump and bustling cook who appeared at the porch of the parsonage of Werffen.

She cast a hasty glance at the empty hands of the youth and the maiden standing by his side, before she answered, in a surly tone,—

"His reverence is now engaged in study. What dost thou want with him?"

No. 882.—NOVEMBER 21, 1868.

Disregarding her words, the couple passed hastily by her into the room, where, in good truth, the father was busily discussing a roasted hare and a bottle of wine.

"What is thy business?" he demanded angrily, while rising, he endeavoured to conceal the good fare on which he was regaling.

With eyes sparkling with pleasure the young man replied, whilst his bashful companion bent her looks to the ground,—

"Reverend sir, we have agreed to enter into the holy state of matrimony, and therefore have come to pray you to unite us."

B B B

PRICE ONE PENNY.

"Who art thou, and what is thy name?"

"I am Hans Weinleidtner, and this is Barbara Manlicken."

"Ah! I think I remember thee," said he, with no very friendly look at the blushing maiden. "Thy father was a tolerably orthodox man, who revered the Lord and his ministers, whom he sometimes remembered when a blessing had manifestly fallen upon his stable and barn. But his brain must have been severely affected by his fall into the Salza, for since that time he has behaved as if bereft of his senses. Instead of sending gifts and offerings to the blessed Virgin, and to our holy guardian saint for his miraculous preservation—instead of testifying by his actions his gratitude to me, his confessor, whose fervent intercession had certainly a great share in his recovery, he senselessly squanders all his goods and property upon a strange, undisciplined, good-for-nothing fellow; and forsakes the Church and the altar in order to associate with innovators and heretics."

"Reverend sir," replied Hans, resentfully, "do not calumniate my master, who is about to make me, a poor fellow, the happiest of men by raising me to be his son-in-law."

"That is another proof of his insanity!" said the priest. "Nay, thou mayst be in the same state of mind as himself, or he certainly would not thus act towards thee. But how standest thou in regard to thy faith?"

"I believe what a Christian ought to believe."

"That is anything but explicit," replied the priest. "A Christian! Oh, holy St. Crispin! what a comprehensive genus! Every heretic, Huguenot, Calvinist, Lutheran, Anabaptist, all claim to be Christians. But I mean a Roman Catholic Christian, excluding every other. Wilt thou and thy betrothed appear at the masses, processions, and pilgrimages? acknowledge the Pope to be the supreme head, and his ordinances to be divine? dost thou believe in purgatory, worship the holy Virgin and the saints? and wilt thou live and die in this faith? and, moreover, wilt thou confirm the whole with an oath?"

The young man shuddered. Silent but powerful was the struggle within him: at length he said, with emotion,—

"Sir, we came to beg for thy blessing upon us, and once more I entreat thee for it."

"It seems I am good enough to assist thee in thy worldly matters," said the priest, "but thou dost not require me for other and more godly purposes. Why dost thou no longer attend my church, eh? why art thou not oftener at the confessional? why dost thou no longer bestow upon the ministers of God what is their just due? My purse, my kitchen, and my cellar, are now quite empty. Wouldst thou have me starve? Must I exchange my breviary for a spade, and toil for my bread? Is it not sufficient that I am a sufferer in every respect, and am now to share even my house, my room, and the remnant of my former income, with a stranger, the Jesuit, whom the archbishop (the Lord forgive him for it!) has appointed as an assistant, but whose coming is, as it were, a reproach to me. Had you all quietly adhered to your ancient faith we should not have had these overwise superintendents, as though we, your experienced pastors, were not as intelligent as these profoundly-learned missionaries. I am not sorry, however, that they succeed better in managing such stubborn, uneducated boors."

With his mouth wide open, Hans had listened to the incensed priest, but, his feelings gradually worked upon, he replied,—

"Shall I tell thee unreservedly, reverend father, the reason why our people so seldom attend thy sermons? They cannot tolerate the continual reviling against Luther's doctrines, and the severe imprecations cast upon his adherents. They desire to be instructed and comforted in the house of God, but not to hear incessant reproaches for their want of faith. That is our objection."

The priest stared at him in amazement. His lips sought words for a suitable answer to the daring youth, who perpetually interrupted him by again preferring his original request.

"Peace, tormentor!" cried the holy father. "Thou shalt not be married before thou and that maiden have made a true profession of faith. No children shall be baptized, nor the dead interred in consecrated ground; neither shall the sacrament be administered to any of you. Such is the command of the most reverend Prince Archbishop. Now choose, fellow, between the curse and the blessing."

Hans gazed in dismay at Barbara, and she at him.

"What would thy father say?" he dejectedly asked of the lovely girl, whose interests were at stake as much as his own on the occasion—"what would thy father say, should I—should we—submit?"

"Ask him thyself," said the priest, who had meanwhile been looking out of the window, "for there he is coming along, though not in very agreeable company."

The astonished couple went to the window, and there an appalling sight met their view. Loaded with chains, surrounded by soldiers, the constable by his side, Manlicken was slowly advancing, pallid, but apparently calm. Catherine and her two sons, with loud lamentations, were struggling to approach him, but were repulsed by the brutal soldiery.

In the next moment, wild with indignation, the betrothed lovers had broken through the guard, who were taken by surprise, and had thrown themselves on his neck.

"Oh! what has happened?" cried both in a breath.

With composed mien, but trembling lips, the father replied,—

"They say that I am a murderer. I know nothing more."

"Thou art not!" they both exclaimed, horror-struck.

"God knows that I am not," said Manlicken, joyfully.

They were now forcibly torn from him, and, joining the rest of the weeping family, followed the prisoner.

But when the priest, actuated by curiosity, presented himself at his door, a sudden thought seemed to have occurred to Weinleidtner, who hurriedly approached him, and seizing both his hands in a supplicating manner,—

"Reverend sir," said he, "thou wert Manlicken's confessor; thy testimony will prevail. Speak, has so fearful a crime as murder ever burdened the conscience of thy penitent?"

"Thou art right," he replied, "he *was* my penitent; but," he added coldly, "a crime like the one in question may be the reason of his being so no longer."

Manlicken, who was sufficiently near to hear the request, and the answer to it, anxiously addressed the priest:—

"Sir, I have revealed to thee the most profound secrets of my heart. Thou knowest but too well what oppresses my conscience."

Father Grinselm, shaking his head incredulously, replied,—

"The human heart is too perverse and intricate a thing to be perfectly fathomed, even at the confessional."

The priest returned to his dwelling, and the crowd moved onwards in the direction of the castle of Werffen, increasing, like an avalanche in its progress, from the multitudes who joined it from all quarters. Every fresh comer was inclined to pity poor Manlicken as an innocent victim of the warden, and openly declared both sympathy and indignation at his unjust treatment; but when it was understood that the prisoner was not a sufferer for the sake of the Gospel, but that he lay under an accusation of murder, they withdrew with fear from a criminal who might perhaps justly be expelled from society. With visible pain Manlicken observed the impression which his supposed guilt wrought upon his fellow-countrymen, and he internally lamented that he was not only deprived of his liberty, but of a reputation which had hitherto been unblemished.

In the same hall where, a few weeks before, Manlicken had so conscientiously surrendered his possession to their legitimate owner, he was now received by the warden, in whose suite the physician of the district attended.

"Manlicken," said the baron, with apparent mildness, "for some time I have been indebted to thee for a few small matters. Gratitude, therefore, induces me to grant thee an immediate hearing. I ought first to humble thee by an imprisonment of two or three weeks, as is usually done. Thou art no doubt aware of this, and on that account will the sooner confess the truth. I shall be rejoiced if, in the course of thine examination, thine innocence be manifest, and should I be enabled to restore thee to liberty. But the suspicion which heavily rests upon thee seems but too well grounded, and justice loudly demands its blood-stained victim. Know, therefore, if thy conscience has not already accused thee, that thou art charged with murder—the murder of the son of thy benefactor. Thou art pale, thou art speechless; ha! such is the triumph of justice! her keen eye can detect even an habitual malefactor. Then, no longer deny thy crime, but by an open confession endeavour to obtain a milder sentence."

"If I really have turned pale," replied the accused, "it is only from sorrow that thou shouldst have deemed me capable of so atrocious a deed. And I now ask thee what right hast thou thus to proceed against an irreproachable man?"

"Insolence here is entirely misplaced," returned the warden, a frown contracting his brow. "We have means in our power to correct it; but I shall first put a few questions to thee."

"What caused thee to conceal, until very lately, the true name of that pretended stranger who died at thy house both suddenly and inexplicably, although thou hadst discovered from his passport and marriage certificate that he was old Pommer's son returning to his home?"

"I certainly did wrong in that respect," acknowledged Manlicken; "but I was in the shadow and darkness of death; for the word of God had not then enlightened me. I was afraid," proceeded he, "although I had acquired my property in a lawful way, that my candour might probably occasion troublesome and expensive litigation, and even deprive me of a great part of my fortune."

"That is exactly what I meant," retorted the warden; "we now come nearer to the point. How, then, if the same consideration which induced thee to conceal both

the name and the death of the deceased, should prove to have been the cause of his death? Wouldst thou feign not to understand me? In plain words, then, was not the sudden death of that person who endangered thy fortune the work of thine own hands, to rid thyself of him? What proof canst thou offer against this suspicion?"

"My conscience, and also my whole conduct. Dost thou think it likely," said Manlicken, "if I had been really guilty of the murder, that I should, of my own accord, have revealed the mystery which enveloped the stranger, and have so lightly yielded up the reward of a dreadful crime, after so many years' silence with respect to it?"

"This very behaviour is evidence against thee," replied the warden. "Thine evil conscience impelled thee to disburthen thy guilty heart of its reproaches, by restoring the wealth of which thou hadst so criminally taken possession. Thou canst not persuade me that any rational person would deprive his own children of an inheritance to throw it away upon a stranger."

"But, sir," interrupted Manlicken, "I did not recognise the runaway son of old Pommer. It was only after his death that I discovered his identity, from the papers which were found upon him. What could have induced me to slay a destitute and unknown being, who entered my house as a beggar?"

"Oh! as for that, he might have informed thee who he was, and even have claimed the property from thee," reiterated the warden.

"That such was not the case," said Manlicken, "my wife and the servants then in my employment can prove; for the stranger continued in their company until he retired to bed. Had it been so, then the boy would also have learned his true name and parentage, which his father had so carefully and effectually concealed from him, that he was totally unacquainted with the secret until I myself informed him, when I surrendered the estate."

"Oh! but curiosity," replied the baron—"even a slight family resemblance might have induced thee to search for his papers whilst he slept. Everything is possible."

"By no means," said Manlicken; "he had only taken off his coat, and we did not find the document, which he had concealed on his person, until we were vainly endeavouring to restore animation."

"Are those witnesses still alive?" inquired the warden.

"A woman-servant, who is now married, is living at Schwaback; but the man-servant has left the country."

"That is a bad thing for thee, Manlicken. How long is it since the stranger's death?"

"In November next it will be thirteen years."

"If we were to disinter the body, doctor," said the warden, turning to the medical man, "couldst thou pronounce whether he died a natural or a violent death?"

The latter, shrugging up his shoulders, replied, "It would be impossible: decomposition is too far advanced."

"So much the worse for thee, Manlicken. Though I would gladly shield thee, I cannot do otherwise than keep thee in custody until thou shalt confess."

At a sign made by the baron, the prisoner was again fettered and conveyed into the dungeon of the castle.

His family, who were in the deepest distress, were obliged to wait in the ante-room during the examination. With loud lamentations they received the discouraging decision of the warden, and they followed the prisoner with tears and sobs to the steps leading to his damp

and subterranean cell; and he was scarcely permitted to address a few words to those who were dearest to him. On going to the apertures, which admitted a feeble light into the dungeons from the courtyard, to discover, if possible, where Manlicken was placed, a loud scream from Barbara caused them all to leave off their search, and run to the spot where she stood. She thought she had heard a sound of pain; they all continued listening with the most profound attention. A slight clanking of chains, which was just audible from the depth below, was the only farewell which the beloved prisoner could give to his sorrowing family.

Almost daily this aperture was besieged by some member of Manlicken's family. As Barbara was one day kneeling before it, hardly daring to breathe, lest she might lose the means of obtaining a knowledge of his fate, a deep groan caught her ear. Barbara moaned audibly. A sound of a different kind, as if occasioned by falling blows, was then heard, and was followed by louder groans. She plainly heard her father imploringly say,—

"Have mercy upon me, an innocent man! Oh, leave off."

Fresh blows, accompanied by cries of pain, again pierced the daughter's heart. Then the enfeebled voice of the tortured Manlicken was heard praying,—

"Oh, my Lord and Saviour, deliver me from the misery of this life, and take me unto thyself!"

Barbara's scalding tears flowed faster and faster, but with a violent effort she suppressed her sobs, that she might hear more of her poor father; but when at last all was still and quiet, and even her calls remained unanswered, she quitted the court in a state of distraction.

"Who was that pretty young girl?" asked the young Baron Von Motzel, who had just arrived from Salzburg, and now addressed the warden of the castle.

"She is the daughter of the prisoner, Manlicken, my lord, and thou mayst often see her at that spot weeping piteously. She grieves for her father even more than for her lover."

"So! has she a lover too?"

"Yes, she has one to whom she is betrothed. They are only waiting to be married, for which they may wait long enough before Father Grinselm consents to it; for she also belongs to the set of heretics."

The baron made the warden relate to him her whole history, and every particular concerning her. At the conclusion he left the warden and went in search of his father, pondering on a design he had already formed, as he went out.

Barbara, disconsolate, and weeping bitterly, walked quickly through the fields until she arrived at the Schüppelhof, with the full determination of delivering her father, cost her what it might. With eyes red and swollen, giving evidence of her grief, she entered the little parlour which had formerly been the sitting-room of the family, and in which Peter was now occupied cleaning his gun. Barbara was well pleased at finding him alone.

"Cousin," she began, hastily wiping away her tears with her apron, "why hast thou accused my father, who has done so much good to thee, and who is as unsullied as the sun?"

"Did I not think that the blame would be laid on my shoulders?" exclaimed Peter, violently knocking his gun on the floor. "What have I to do with the charge against him? It is nothing but the warden's handiwork, who has contrived the whole affair for the purpose of getting the heavy costs and expenses out of us. It is

for this reason that I have been examined so often, and on this account there has been so much searching and taking of inventories in this house. All this must be paid for, and will thus enable the warden to discharge his debts. Barbara, I can hardly refrain from taking violent measures with him. Why should he harass thy father so? But stay, I recollect now what good Manlicken once told me, and that was, that the warden was so enraged with him because he would not give him back his bond which he held for four hundred florins, and which is now in my hands."

This declaration strengthened Barbara's intention. In order to introduce the subject of it she commenced, "My dear Peter!" all the blood forsook her cheeks, and she made a dead pause—"I once appeared to be a little in your favour."

"And still are—not a little—a great deal—very highly!" he exclaimed, warmly.

"If I now—" said she.

"Well, if thou what?"

"How much dost thou think I am worth?"

"All the treasures in the world," said Peter, warmly.

"Ah, no; pray do not joke now; I am in bitter earnest. How far wouldst thou go to have me?"

"To the top of the Watzmann," cried Peter.

The young maiden stamped her foot in anger; then weeping bitterly she again resumed her purpose.

Peter little knew what conflicting emotions were then at work in her bosom, over every affection a daughter's love for her father bearing sway.

"Do but understand, Peter," said she. "In the Bible we read that the Ishmaelites only gave twenty pieces of silver for Joseph; but for me—Barbara—thou must give more—a great deal more. In short, for four hundred florins, and not a heller less, I am thine, if thou art still inclined to have me."

"Aye, very well;" said Peter; "but thou didst thyself tell me that thou couldst not endure me."

Barbara, looking evidently confused, replied,—

"But now I am more favourably disposed towards thee, Peter. Thou didst behave with much generosity towards us upon our removal from the Schüppelhof."

"Ah!" said Peter, not a little flattered. "But what must be done with Hans, thy betrothed?"

"Do not speak of him," exclaimed Barbara, excited in the highest degree. "But yes or no!" said she, wildly: "wilt thou give me the warden's bond or not? Wilt thou have me or—"

But Peter had limped away to the desk in which he kept the document, and now holding it out towards her, he said,—

"There is what thou requirest."

Barbara hastily snatched the deed from him.

"Now, give me thine as a pledge that thou wilt be mine," said Peter.

"Yes; but it must be on condition that if with this bond I can liberate my father—"

"Well, be it so," murmured Peter.

Barbara gave him her hand, her whole frame trembling with agitation.

"Now one thing more," said he. "Thou art about to give the bond to the warden, but do not deliver it before he has set thy father at liberty. Ask for his release in his own handwriting. Dost thou understand me? And tell him that otherwise I will arraign him before the archbishop, the emperor, and the diet of the states."

On the wings of the wind Barbara sped back to the castle of Werffen. She was ushered into the presence of the warden, before whom she pleaded her cause with all the skill of a practised advocate, displaying so much

circumspection and ability, that with the aid of the document she fully attained the object of her visit. The warrant prepared for this occasion set forth the facts, and the insufficiency of evidence, together with the refusal of the son of the deceased to institute criminal proceedings against Manlicken, as the reason of his liberation. Eventually both Manlicken and Peter had to pay a considerable sum, the former as a penalty, the latter for the expenses incurred in the prosecution.

Barbara enjoyed the sweet reward of the sacrifice of her own feelings to her filial affection when she beheld her father ascending, or rather staggering, up the steps that led from his living tomb. Even the heart of the dissolute courtier, the young baron, was agitated by an unusual sensation at the touching scene of their reunion. But who can describe the scene at the moment when the father, pale from the cruel usage he had received, and leaning on Barbara for support, came into the midst of his family? Alas! none observed that after the first burst of delight at the return of Manlicken had subsided, Barbara, pale as the marble statue at the fountain of Salzburg, sat down speechless and fainting as she contemplated with anguish her future prospects. On the following morning, with increased sorrow and disquietude, she prepared to depart. Frequently she essayed to inform her parents and her brothers of the lot which awaited her, but the words died upon her lips; she had not the courage to cast her beloved Hans from the bright hope of the future in which he was indulging to a state of utter despair.

A loud knock at the door made her start as if she were a murderess. Her sad forebodings had not deceived her. The door opened, and the red head of squinting Peter peeped into the room. "Good morning," said he, drily. "I am come to fetch my sweetheart to the wedding. Art thou ready, love?"

Her countenance assumed a deadly paleness as she answered firmly, "I am."

"Well, then, come with me." He seized her hand, to lead her out of the room.

It was but natural that Hans should be the first of the astounded family to oppose this proceeding. But when Peter in decided terms asserted his claim to the maiden, referring to her own testimony in his behalf, and when Barbara confirmed its truth, there arose an outcry of sorrow and protestation. Hans, weeping aloud in agony of desperation, was on the point of felling Peter to the ground with a billet of wood, which he had seized. Manlicken looked for his walking-stick to return to his dungeon. Catherine implored their kinsman to resign his claim to her and take away the whole of their property instead. The brothers held their sister fast in their embraces, and would not part from her. But the cripple, relying upon Barbara's promise, continued inexorable.

"Well, how is all this to end?" he earnestly asked the wretched victim, who, releasing herself from the arms which were thrown around her for her detention, took Peter's hand, and uttering a half-stifled farewell to the astonished family, left the room. But she could not advance farther than the passage; her strength forsook her, and had it not been for the support of her newly betrothed, she would have fallen to the ground. Placing her upon a seat, he said with much emotion:—

"Barbara, I should be happy in calling a beloved being my own; to love and be beloved, and to participate with her both joy and sorrow. But when I see thou feelest as if I were leading thee to thy death, I cannot make thee unhappy. Go," he cried, passionately—"go

to thy Hans! I give thee back thy promise! Thou art free! May thy father unite thee to the man of thy choice."

Tears, which could not be repressed, rolled down his sun-burnt cheeks as he spoke. Then, taking the hand of the perplexed maiden, and not venturing to look again upon her face, he left the house as hastily as his lameness would permit him.

LIFE IN JAPAN.

IX.

MONEY.

SOCIETY is divided into orders, according to occupation, and merchants and traders of every kind occupy the lowest grade in the scale but two, notwithstanding that they form so large a proportion of the population, corresponding, one may say, to our middle class. Women engage in various kinds of trades. At silk shops, lacquer ware depositories, fruit, vegetable, flower, and fish stores, women buy and sell, bargain and receive payment.

There are gold, silver, bronze, and copper coins. The most valuable is called an obang, and is worth from £15 to £25, according to the weight of gold: this coin is very large compared with European pieces of money, being an oval-shaped plate of pure gold about five inches and a half long, by three broad.

There are two other kinds of gold coin, the old and the new cobang: the former is worth thirteen silver boos, or a little over eighteen shillings of our money, while the latter is only equal to four silver boos, or

about five shillings and sixpence. The boo is the silver coin, and is here depicted: it is an oblong piece of solid silver, about an inch in length, and somewhat resembling a domino in appearance, with its name stamped upon it in Chinese characters, and the name and seal of the prince in whose territory it was issued. One Mexican dollar is equal in value to 3·11 boos, the Mexican dollar being the ordinary medium of exchange between Japanese and foreigners in their commercial transactions. A boo is therefore worth about one shilling and fourpence three farthings of English money. Half and quarter boos are largely in circulation, and then next in value comes the tempo, a

large bronze, oval, well-made coin, with a square hole in the centre, by which it may be strung on a string with a number of others. The tempo is worth about a penny, being the sixteenth part of a boo. Last in value, though most in use amongst a population where the necessities of life are so cheap, is the copper cash, a round coin about the size of our shilling, with a square hole in the centre for the same purpose as the similar aperture in the tempo.

The cash is made of inferior copper largely mixed

with iron and sand, and is a badly-executed piece of money compared with the carefully-produced gold, silver, and bronze coins. The constant friction it undergoes when passing rapidly from hand to hand may be the cause of the impressions being so much less perfect than those of the superior kinds of money. Its value is infinitesimally small, being the ninety-sixth part of a tempo, or the twenty-fourth part of a farthing, yet many articles in daily use are separately worth but a single cash, and can be purchased for this insignificant outlay. Strings of cash separated into lengths each containing a decimal part of a boo (between sixteen and seventeen hundred being worth a boo) are carried over men's shoulders, purses being impracticable for such a weighty commercial medium.

The boos, when issued from the mint, are wrapped up in packets, each containing one hundred pieces. The Government stamp is impressed on the tough paper which encloses them. They circulate thus as one piece of money without being counted, and thereby facilitate large operations.

Gold, silver, copper, and many other metals abound in the volcanic soil of Japan. A limited quantity only is permitted to be annually extracted from the mines, lest the supplies should become exhausted, and posterity be left without a sufficiency of metal.

The tempo is the coin for which little boys used to clamour so eagerly when foreigners passed through the towns and villages. "Tempo cashee," "Tempo cashee," "Give tempo," "Give tempo," was the constant cry shouted out by the youngsters of both sexes who flocked round the strangers, and appeared to think that Europeans carried with them boundless stores of this useful coin. Some naval officers who accompanied the first expedition to Japan, found that buttons were also much appreciated by these vociferous young people, and kindly denuded their uniforms of the gilt anchor in order to gratify them, so that "Bouton cashee," "Bouton cashee," was as loudly heard as "Tempo cashee," when any officials were present.

The boo is the nearest approach to a unit or standard of value, though the Japanese cannot be said at present to have any definite standard. They are, however, contemplating great changes in their coinage, and it seems probable that the standard adopted will be of silver, and that the form of the coins generally will be circular.

PICNICS.

ONE of the most characteristic of Japanese amusements is a picnic; in fact, they may be called, *par excellence*, the pic-nicking people. Sometimes the summit of a hill, sometimes a temple, sometimes a tea-garden, is chosen as the scene for passing the day in the open air. The means are simple enough and the expense trifling. When looking over articles of Japanese lacquered ware, we often find amongst them a variety of handy arrangements for carrying eating utensils: plates, basins, cups, bottles, and a tea-pot, are scientifically fitted together so as to occupy the least possible space; and equipped with one or two of these "chow-chow baskets" (as Europeans, in their debased Chinese-English, term them), well stocked with provisions, a Japanese family betakes itself to the spot selected for the day's recreation. This is always some beautiful spot chosen for the loveliness of its scenery, or because it is consecrated by some religious observance. Sometimes it is on one side of a mountain, clothed to the summit with graceful bamboos, dark pines, and the polished leafed orange-tree, or on the banks of a rippling stream,

or by a land-locked bay, under the shade of bright-blossomed azaleas and delicate-tinted camellias. The day is passed in tranquil enjoyment; the ladies of the party displaying their accomplishments in reciting poetry, singing to the accompaniment of the *syamsie*, or guitar, or telling stories; or jugglers are hired to entertain the pleasure party with their tricks.

If it were not for that bane of all innocent enjoyment, strong drink, there would be much to admire in these pleasant rural amusements. Unfortunately, a supply of sakee is always taken in the picnic-basket, and though much tea is also drunk, warm water being always procurable at the numerous temples and tea-gardens at hand, yet the usual result of the indulgence in alcoholic beverages is often manifest, and a day which should have been spent in the enjoyment of nature's tranquil beauty ends too frequently in noise and drunkenness.

At the summit of every hill near a large town a little chapel or oratory may be found—a small erection built of stones, and dedicated to some kami or holy person. These oratories are the excuses for innumerable picnics, for on a certain day in every year each of these must be visited, and thousands of people—men, women, and children—leave the town, climb the steep hills, and cluster round these praying-places, till the top looks from a distance as if covered by a swarm of bees. Devotion at the shrine does not occupy much time, and then the chow-chow baskets are opened and the contents consumed.

The spring and autumn are the seasons when these excursions are most enjoyable and the greatest pleasure can be derived from the delicious climate and lovely scenery. At these times the air is bracing and invigorating, the sky bright and clear; and on the verdant hill-sides one drinks in draughts of air, wafted across the bright valleys, that exhilarate the spirits and make mere existence delightful. The sense of sight, too, is gratified in the spring time by the varying tints of the shrubs and plants. The plots of rape-seed dot the hill-sides with their yellow blossoms, and the fresh light green of the small rice-fields is interspersed with the broad leaf of the lotus plant, the bright yellow melon flower, and the overhanging foliage of camphor and wax trees. It is in the spring that the pomegranate puts forth its brilliant scarlet blossoms, and the trellis-work, over which the pear, peach, and plum blossom are trained horizontally, sometimes for more than a hundred square feet, looks like huge arbours, the wood-work being entirely hidden by the bunches of white and pink flowers. The westeria twines its branches round the supporting maple and evergreen oaks, and trails its long lilac blossoms amongst their dark foliage.

The fact that the Japanese are not sportsmen renders the birds wonderfully tame: they have nothing to fear from men's approach, so that they do not instinctively shun them as their enemies. In the large moats round Jeddo immense flocks of wild fowl—creatures in other countries so timid and shy—feed undisturbed, and add the charm of life and movement to the scenery. The wild goose, the teal, the mandarin duck, the graceful white paddy bird, and the crane, pass their existence there as if they knew of the decree issued by the Tycoon's government, that no gun shall be fired within ten re, or thirty miles, of the city.

The rainy season and the warm summer put a stop for awhile to the pic-nicking propensities of the people, but in the autumn they can again indulge in these national as well as natural pleasures, as the air is still balmy, and the varied colouring of spring, indicative of

the renewal of life after nature's winter sleep, is exchanged for the scarcely less beautiful, though more sombre hues, that prelude the fall of the foliage. The maple-leaves turn scarlet, while the numerous evergreens still afford shade and verdure to the landscape.

GAMES.

CHess and draughts are amongst the sedentary amusements of the Japanese. The latter is a very elaborate game: a large board is used, and the pieces number over four hundred: the directions in which they may be moved are very numerous.

The Japanese game of chess can easily be understood by a foreigner; it is a great favourite amongst them, and they call it *Sho-Ho-Ye*. The inmates of the guard-houses often divert their leisure hours with this, and another, which resembles the well-known European game of *loto*, only that it is played with small black and white stones. Card playing was unknown in Japan till it was introduced by intercourse with foreigners in the sixteenth or seventeenth century. The pack consisted of fifty-two cards, but so much gambling resulted from their use, that a decree was issued forbidding the Japanese to play with them under heavy penalties: this decree is, however, evaded by the use of smaller pieces of cardboard, forty-eight in number, which can be made available for the same purposes as the larger ones, though they differ from the European model.

The excitement, too, of games of chance is carried on by means of dice, and exquisite little sets of dice, made of ivory, and inlaid with ebony and coral, are carried about the person, a set of them being enclosed in an ivory box three quarters of an inch long, or in a globe the size of a large cherry.

The Italian game of *moro*, so dear to the Neapolitan *lazzaroni*, which enables them to kill so much time, is represented in Japan by a somewhat similar game with the fingers.

The flying of kites is undertaken with such seriousness, that it seems almost without the category of mere amusements; men, not boys, are the kite-flyers, and they will stand or sit for hours regulating the flight of the grotesque figures borne on the breeze at the end of the long strings. Figures of animals, birds, centipedes, men and women, etc., are made to ascend, and do not seem more difficult to manage than the kite of common shape, with the long tail of strips of paper, which we are accustomed to see.

A LADY'S JOURNEY THROUGH SPAIN.

CHAPTER XIII.

WE returned to Madrid from Toledo, as we had engaged our carriage at the former place, and we had also to take a final leave of kind friends before our departure from Spain. I will not dwell on those always melancholy last days, nor yet can I afford to linger on my road; but I must say a few words respecting the Basque provinces, as both the country and its inhabitants well deserve some notice.

The Basques are the most thoroughly national of all the Spanish people, regular mountaineers, having had less admixture with other races, as they generally contrived through every change to keep themselves to themselves, as the saying is. One singular characteristic of this people is their equality: all claim to be the veritable Spanish *caballero* untainted by any cross, whether of Jew or infidel. Their pride is something astonishing; and where all are equally proud, it is im-

possible but that offence must sometimes be given. However, they do not bear malice, and quarrels are soon made up again. Their bravery is undoubted, and they are said to make excellent soldiers, but more in their own guerilla kind of warfare, than amongst regular troops and in a pitched battle. Though now incorporated with the Spanish provinces, the Basque country is still governed by its own peculiar laws and constitution. Many a hard struggle have the Basques maintained sooner than permit the slightest infringement of their rights. This has given a sort of determined, independent character to these people, as peculiar as it is attractive. In some respects they resemble the Tyrolese. The country also differs widely from all other parts of Spain: it has neither the soft luxurious loneliness of the southern provinces, nor the grandeur of the wild mountain regions. It is more a peaceful, smiling, pastoral country, with secluded valleys, gently rising hills, clear sparkling streams, verdant pastures, and fertile, well-cultivated lands. Agriculture is well understood amongst the Basques. The timber is very fine. In some parts oaks and chesnuts cover the hills. There is excellent fishing in many of the streams.

We made a halt at Irun, the first town on the Spanish side. It is on the high road to Madrid. For travellers coming from France into Spain it may indeed be called the first Spanish town on that frontier; and as such it of course will always possess a sort of interest which it has no other claim to. We only halted there as a starting-point for an expedition to St. Sebastian.

As the weather was still so delightful, we determined once more to give ourselves the pleasure of a riding excursion. Accordingly, having procured suitable animals, we started on a morning so warm and bright that, had we not known beyond a doubt that it was the month of November, we should have pronounced it to be a lovely glowing day early in September. It was enchanting. The road ran along the coast, and greatly we enjoyed the sight of the sea, and the varied costumes of the Basque peasantry. The women have beautiful hair, which they wear in long plaits down their backs, and adorn, for any festivity, or on the saints' days, with coloured ribbon. The married women cover their heads with a very unpicturesque sort of hood. The young girls have bright, fresh complexions. The men wear the sandal almost universally. The one great passion of the Basque peasantry seems to find vent in pilgrimages to their favourite shrines. There is no trouble they will not take to accomplish their object, and no distance they will not travel, even on foot, to reach some pre-eminently holy shrine, frequently for the benefit, as they credulously believe, of some relative especially dear to them, who may be suffering from one of the many ills that mortality is heir to. Prayers offered up at these shrines are looked upon as far more efficacious than any prayers offered up in a church near at hand, and they most implicitly believe that if the sick are to be cured this is the way to accomplish it. Many and many a time during our residence in Spain did we meet parties of the country people bound on some such errand; and affecting it sometimes was to see the utter forgetfulness of self, the patient endurance of toil and fatigue, the warm affection, the loving hopefulness displayed, even in connection with these baseless superstitions.

San Sebastian is a very striking spot, situated as it is on an elevated rock, that seems actually to overhang the sea. Indeed, it is almost surrounded by water, as the

river Urumea runs down into the sea on one side of the town. Fishing seems at present to be the occupation of nearly every man, woman, and child in the place. Any one staying at San Sebastian will be pleased to profit by their labours, for I do not think that I ever tasted such delicious fish as those that formed part of every repast during our sojourn. The historical asso-

The climate is very salubrious, and at the same time agreeable. It is very easy of access, and as railroads increase will become even more so; and there are many objects in the neighbourhood to attract and interest strangers. The environs are very attractive: there are picturesque hills, green wooded glades, beautiful chesnut groves, and pretty villages perched high

IRON.

ciations of San Sebastian are so well known to all the world, that it would be useless for me to allude to them. We thoroughly lionised the town, but it is more interesting to see than to describe.

The ride to Tolosa, especially the latter part of it, was charming, through country beautifully wooded with fine chesnut-trees, then in all the golden glory of the autumnal change of the leaf. The district strongly resembles parts of Switzerland, but it has a bright rich tone of colouring belonging to the more southern climate. Certainly our last ride in Spain was as enjoyable as we could have desired.

From Tolosa we continued our way, still riding, to Vittoria, which some of our party had a great desire to see, on account of the memorable victory gained by the Duke of Wellington in the war of the Peninsula. The town of Vittoria is a most busy, flourishing, populous town, unlike in nearly every respect the towns that we had lately been visiting. Cheerfulness was the peculiar characteristic of Vittoria; of course I speak of the modern town. There is an old portion of the town that is dark and gloomy enough. Nothing can be more delightful than the alamedas or public walks. One outside the town, called La Florida, or "The Flowery," is charming, and in the summer season must well deserve its pretty name. One day sufficed for all that we wished to see. I should think Vittoria would be a charming residence for a family wishing to economise. The living was wonderfully cheap and very good; poultry, vegetables, and fruit, all were to be obtained in abundance, all excellent, and for most moderate prices.

up on the different eminences. The dress of the peasantry is peculiar to that neighbourhood. The dark blue cap, or bereta, as it is called, I think a very becoming head-dress. I cannot say as much for their mode of attiring their legs and feet: they are rolled round and round with what we should call bandages, and then on their feet they wear the universal sandals. The bandaged legs give a very clumsy appearance. The houses are built with wonderful solidity, as if each separate dwelling was to sustain a siege. The coats of arms of the proprietors are always carved over the entrance. The pride the Basque families take in these armorial bearings is a feature to be noticed. They are almost all good scholars in heraldry, and look upon it as an essential part of a gentleman's education.

All the country of the Basques recalls the struggles between the Carlists and the Christinos, and the life and adventures of that celebrated guerrillero chieftain, Zumalacarregui. Not a hill did we ascend, not a village did we pass through, that had not its memories of that stirring time. Truly the memories belonging to most Spanish scenery are anything but peaceful in their nature! The ride the whole way was full of interest, and the country as picturesque and delightful as any I had seen. An artist might quickly fill his portfolio, so picturesque are the points of view, so completely do they possess everything that is most effective in scenery. The streams are enchantingly clear and sparkling, and most of them abound with fish.

But we must come to last pages and last words, however unpleasant they are. A feeling of sadness

oppressed our whole party as we crossed the bridge over the Bidasoa, and knew that Spain was left behind us. I can only hope that those readers who may have accompanied us through our long journey may in some measure sympathise with us in our regrets, that a time of such unusual enjoyment was at an end, that friends and companions so endeared to each other by the pleasures and toils they had mutually shared, must now part and each go their separate way. Two of the party were bound to far distant lands, one to return to England; and I myself intended to try how far prolonged rambling would indemnify me for the pain of such a parting. The islands of Corsica and Sardinia were to be my destination. One parting word of Bayonne, the town whence we all started on our different routes. The wild and lofty ranges of the

Our last night was spent at Bayonne—the last of the undivided party. From thence one of our gentlemen started to make his way as quick as he could to England, while the remaining three went first to Paris and thence to Marseilles. My two companions went by the overland route to India, and I accomplished my voyage safely to Corsica. When these pages meet the eyes of my fellow-travellers, they will, I hope, recall to their minds the pleasantest nine months that I at least ever spent.

MOTHER'S WORK;

OR, THE EDUCATION OF THE HEART.

BY MRS. ELLIS, AUTHOR OF THE "WOMEN OF ENGLAND."

CHAPTER VI.—THE MOTHER.

IN venturing so far into the mother's department of work, I am not unconscious of being upon delicate ground, nor insensible to the liability which I incur of being charged with presumption, as if those who are practically engaged amongst their children do not know better than any one else can teach them, what ought to be done and what can be done. Others who are closely pressed with the business of each recurring day may ask, not unreasonably, how sufficient leisure is to be found for all this education of the heart.

Let such mothers, and indeed all mothers, bear with me while I assure them that all I am pleading for is this—that an equal proportion of effort should be given to the education of the heart—to the training of the affections, desires, and motives of the young, as is now given to the training of their intellectual powers. I would also include equal attention to the physical nature of the child, seeing that these three are included in human character—the physical, the moral, and the intellectual, and that no one of the three can be neglected, or allowed to sink out of proportion, without serious injury to the whole.

Hitherto I have said little about the body, because it is the custom, I might almost say the fashion, of the present day to give to the maintenance of health a prominent place in public lectures and studies, and, indeed, in those more general measures for the promotion of social progress which include a high estimate of the value of wholesome air and food, as well as a knowledge of various other means of improving the physical condition of mankind. Much as these means have been neglected and undervalued, especially amongst the poor, a due regard for the laws of health is now so often and so strenuously enforced by the more enlightened portions of the community, and especially by scientific men, and by the press, that the subject can demand no notice from me. I only speak of what is neglected—of what is left out of due proportion in our systems of education as generally conducted.

No one can deny, or wish to deny, that the nursery is the mother's department, over which her rule ought to be absolute. But in order to rule there it is not necessary to be entirely occupied with the details even of such a department. Since the mother cannot be present in all places at once, nor with all her children at once, the question arises, Which department of maternal interest can she most safely commit to inferior agency?

Instinct would keep the human mother in the nursery, just as the mother bird would sit brooding over her unfledged young. But the human mother has a range of duty extending far beyond that of the bird; and in considering the whole character of her child, as an im-

A ROADSIDE SKETCH IN SPAIN.

Pyrenees render all the neighbourhood of the French town highly picturesque. Two fine rivers, the Nive and the Adour, add greatly to its beauty; it is, as it were, the key of the mountain passes of the West Pyrenees, and it is reckoned one of the strongest fortified places known. We made a point of visiting the small enclosure where rest the mortal remains of many of the English soldiers and officers who were killed in 1814. The only other place we visited was a very different one—the gloomy old castle said to have been the residence of the infamous Catherine de Medicis when she brought Charles IX, her weak tool in all her wicked schemes, to Bayonne, to hold a conference with one as wicked and infamous as herself, the celebrated Duke of Alva. At that meeting it is now well known, according to later histories, that the appalling massacre of St. Bartholomew was determined on, and settled in all its awful details. Far different are the associations which connect England with the town of Bayonne: for these I refer my readers to the despatches of our great Duke himself.

mortal as well as human being, she has to bring into exercise on its behalf those higher powers and faculties of her own which are capable of this expansion—which are capable, indeed, of all the heights and all the depths of which it is possible for us to form any conception.

Amongst such conflicting and yet urgent claims, the mother has to ask one of the most important questions which can be presented to any human being actually engaged in the practical duties of life. Yes, and she has to answer this question too, "What am I to do, and what am I to leave undone? I cannot do all that I would, not even all that wears the aspect of duty. Which is it absolutely necessary that I should do?" In settling this point rightly for herself the mother is acting out a very essential part of true greatness; and in rightly instructing her children in these matters—how they may all through life ask themselves this question, and how they may habitually answer it in the best way—she will be preparing them in a most effectual manner for working out the highest purposes of a useful and noble life.

On points of this kind it is not enough to be well-meaning, or even devoted. The devoted mother, without any clear idea of the relative claims of duty, may become a slave where she ought to be a queen; and slavery on the part of those who have to do with them is never good for children. It makes them selfish and tyrannical. The mother's legitimate place in her family is high, and nothing should degrade it in the eyes of her children. What is lost by servile drudgery, without intellectual and moral dignity, can never be regained with them. Even moral dignity, without any great amount of intellectual attainment, goes far with children, and is of inestimable value in the mother's treatment, and in her influence over them. We often see this where the maternal government is in the hands of a woman of high principle, not otherwise remarkable; and we find it in the after conduct of her family—it may be in the character of a strong, brave man, who sets his face, like a flint, against dishonesty and meanness of every kind, because his mother taught him to love truth and justice, and to hate a lie.

But if the mother, in order to fill a place of true dignity in her family, does not require any high scholastic attainments, she does require a nice discrimination in order that her sense of duty may be rightly regulated. She requires also a clear insight into character, and above all, a supreme value for that which is highest and most noble. Much, indeed, has to be taken into account by us all in selecting, amongst the claims which press upon us, that which we absolutely must do ourselves, and that which may with safety be committed to others; or that which we absolutely must do now, and that which may be left to a future day. All this has so often to be seen and acted upon in a moment that there is the more need for making such calculations and such conclusions habitual. The mother who has done this before her marriage will find the full benefit of the habit in her own home, where claims apparently conflicting press upon her from every side, and that continually.

It is a sad mistake for the mother, in devoting herself too much to the nursery, to forget that she is a wife. The society of a tired nurse is apt to become a little wearisome, even to the best of husbands; and that is a dark day for any home when a man first discovers that the companionship of his wife is not interesting to him, and that he must look for refreshment to his mind elsewhere. To the young wife, spoiled by a flattering, foolish courtship, it may feel a little hard that, when she

is worn and dispirited by toiling all day amongst her children, she should not herself be the one to be amused and refreshed; and perhaps, happily for her, such may be her reward sometimes. But the social life of a large portion of the community does not appear to be conducted upon this plan; and certainly it is wisest and best for the mother to do her part faithfully, by keeping herself ever in readiness to minister to the refreshment, and even to the amusement, of those around her. Children, as well as men, require both; and many have been kept at home, and even influenced for good, unconsciously to themselves, by that charm which a woman can diffuse around her own fireside by her cheerful and racy conversation, and by the zest which she can thus impart to the common and otherwise insignificant affairs of life.

The struggling after high themes, and the dragging in of especial and important topics to be discussed on all occasions, is not at all what I mean; rather, as already said, that racy kind of conversation which, leaning often to the humorous, can yet give to what is talked about touches of tenderer feeling and deeper interest as occasion may offer; such, for example, as characteristic incidents, described with graphic detail, but always described kindly; or circumstances of local interest which may have occurred during the day. Indeed, whatever there may be in passing life—and life is always rich and full to a quick-feeling and appreciating woman—whatever there may be of droll or serious, of strange or new, may form material for that abundance which flows naturally from the heart of a woman who is happy in her home, in her husband, and her children, and who, perhaps unconsciously, is the source and centre of that happiness herself.

All this, however, which I would call only the by-play of social intercourse, will, by a wise and quick-feeling woman, be readily made secondary, and so give place to any higher or graver style of conversation which others may wish to introduce. It is only the cheerful and pleasant filling up of the spare moments, or the tired moments of social life, which I have been attempting to describe; yet happy is that life whose spare moments are well filled up by a cheerful, sensible, and right-minded woman.

And then, when the deeper and more important topics of conversation are introduced, and the mother takes no mean part in the discussion, but rather evinces an intelligent interest in what is going on, with a knowledge at least sufficient to enable her to ask sensible questions and make rational remarks; or if, beyond this, she can go deeper, and contribute her share of useful information on the case in point, and her share of earnest thought and wise conclusion, what a triumph for her children, and especially her boys, to listen, and find that the mother—the kind, loving mother, to whom they went with all their little wants and wishes—the mother who sung the pretty nursery songs, and made the merry laugh go round when they gathered about the winter fire—that this mother is equal to the best in society—that she knows as much as the men, and can talk as wisely and as truly to the purpose!

Of the many kinds of pride which we have, by common consent, agreed to call legitimate, I know of none so much so as this—the pride of children in their parents, and especially the pride of a son in his mother. There is something in this feeling so sustaining to all noble purpose and all worthy action, that the wonder is how any woman should allow the feeling to die out through indolence or carelessness, and so lose the strongest hold she will ever have upon her boys as they

grow up to manhood. The greatest earthly glory, as it appears to me, is that of parents surrounded by their children, who not only love, but who admire and honour them. Much of Christian duty also hangs upon this, for how can children honour those parents who do dishonour to themselves, and so reduce to a pretence or a mockery this sacred injunction.

It may be that the mother has been entirely swallowed up in her nursery; or, on the other hand, it may be that her time has been so absorbed by the claims of society—*external* society, not the society of home—that her children, as they grow up out of the nursery, scarcely know what their mother is as a companion. In their walks they are attended by nurses, often the most ignorant of human beings. In their play they are gladly got rid of and escaped from. During the chief portion of the day they are consigned perhaps to a governess, whose heart is naturally in her own home, her interests centred in her own brothers and sisters, one who considers herself engaged—in fact, is engaged—for a certain amount of work, and who, if she works hard and teaches all the lessons stipulated for faithfully, does her part well; and thus the children in many families do not really know their mothers, nor does their mother really know them.

There was a time when the coming of the little stranger into the world awakened the liveliest interest in the mother's heart; when, to know that every limb was rightly set, and every function healthy, was more to her than any other consideration just then; when, if a suspicion had flashed across her mind that the spine was ever so little twisted, or the head strangely shaped, or the feet not likely to stand well, a horror would have seized upon the mother, and doctors would have been sent for, and authorities called in, and every means which human intelligence could suggest would have been brought into use, so as, if possible, to remedy the defect.

Such, without doubt, would be the right course for the mother to pursue. Only why should a fault in the heart, or a wrong bias of the disposition, not be as thoughtfully examined, as carefully attended to, and as strenuously overcome? Why should such manifestations of health or disease in this department of maternal care be left so much more to the watchfulness and the solicitude of those who cannot feel half the interest which a mother feels in the entire character, and in the whole life of her child?

It is an interesting fact—a provision designed, no doubt, for the preservation of helpless infancy—that all women seem to have by nature more or less of the maternal instinct ready to be called forth by the babyhood of children not their own. Thus the hired nurse does often really feel much of what a mother feels in her association with the nursery. But it is not so later in life, except in rare instances. The maternal instinct being no longer needed for purposes of actual preservation of life, there is nothing left for those who have the charge of children as they grow up, and who are not their own, but duty—a high sense of duty—with such affection as may grow out of the intercourse between the children and their governess or tutor, or between them and their caretakers, whoever they may be. Affection on such terms is not to be bought with money. It is not even “nominated in the bond,” nor would there be any use in its being so. With the parents alone remains this inalienable property of affection; and if they are unable to use it in working out the ends for which it was given them by God, they can only choose deputies, who, working without the natural affection of

parents, deserve more praise than generally falls to their share, if they work faithfully, not always according to their own views of that which is wisest and best, but according to the restrictions laid upon them, and also according to the requirements of society.

No single individual can educate independently, except a parent. No other can freely follow out the dictates of her own heart in this true heartwork. The most enlightened plans, unless approved by society, have often to give place to the old routine, or fail utterly for want of public approval; and parents themselves too frequently are the greatest hindrances in the way of improved methods of education. Those who undertake the actual labour of education, either under the parental roof or in the wider range of school instruction, are consequently obliged to work under many disadvantages, not the least important of which is found in the partial and even false estimate sometimes formed by parents with regard to their own children.

I have often wondered whether it ever enters into the heart of man or woman to conceive what the labour of training and educating their children really is without affection—the affection of nature—in short, the parental affection. “Children are so engaging,” we hear people say. No doubt they are, and if the educator could select about one in ten, and send the others away, the work in hand might be interesting in the extreme. Alas! for the remainder. Alas! indeed, for the one or two, or perhaps more, in every ten—strange, wayward, unattractive, and uninteresting children, sent forth to share the common lot amongst strangers, without one throb of parental or even natural affection to cheer their lot, to screen their faults, to soothe their distresses, or to encourage and help them on their obscure and difficult way. All we can think of in the way of consolation in such cases, is that God is very good, and that he has enriched the hearts of his faithful servants with such floods of tenderness and sympathy that they are able to embrace and care for and protect the otherwise neglected stranger from a distant or unknown home.

The high sense of justice, the faithfulness, nay, even the personal tenderness, with which the unattractive child is sometimes cherished by strangers can never be fully appreciated by the parents, because, happily for them and their child, theirs is the affection of nature to make all equal in a united family; neither can the obligation which parents are under for such treatment of their children ever be fully understood or adequately rewarded by them. The danger is lest there should be cases of failure in this conscientious treatment; and there is always danger in high pressure schools; where the greatest amount of attainment in learning is esteemed the greatest good, there is always danger lest the dull, the inert, or the inferior child, should not receive the necessary amount of encouraging and patient attention.

All this the mother has to ponder in her heart; and seeing that she holds a right over her child which none but a parent can hold—the right to educate it exactly in accordance with her own idea of what is best—seeing that she has a love for that child altogether independent of its own personal claims or merits which none but a parent can have in the same degree—seeing that God has given her that child as her very own, bound by a relation which it bears to no other being in the world—has committed it to her care bodily and spiritually, for time and eternity—the result of such pondering in her own heart must surely be that she has a charge laid upon her in the education of the heart of her child of

greater importance to it and to her than anything else in this world can be to either.

There may have been but little in the education of the mother herself to prepare her for this work; but instead of looking back to the wasted moments of her own life, and the mistakes of her own education, let her look forward and take courage, determining that, with God's help, she will make her own daughters more fitted to be the mothers of another generation than she felt herself to be when first the great responsibility came upon her. Even to feel this responsibility was something. To suffer from a want ourselves is often a stimulus spurring us on to supply that want to others. And although the work before her may look very arduous, very complicated, and even impossible to be done so well as she desires to do it, there is no getting rid of the great fact that it is her work—appointed by Him who is not a hard taskmaster, but in her day of toil will give her moments of refreshment, buds of promise in her little garden, flowers of beauty, and fruits to be treasured in His own garner when her careful hand and anxious heart shall be at rest for ever.

A few more words of encouragement to the mother, for I believe that women perplex themselves and hinder their good work by thinking too much about their own ignorance on some of the great and important topics which engage the attention of men. They are sadly hindered, too, and sometimes fatally, as regards their influence, by the habit encouraged amongst young women until they marry—a habit encouraged by men, and by society in general, of thinking that they require nothing else than a few accomplishments, with good manners, good dress, and an agreeable face and person. And, for a succession of evening parties, perhaps this would be enough.

But human life, regarded as a whole, is something very different from an evening party, and that every woman discovers when she finds herself a wife and a mother. Yet still I would say, let her not be discouraged. It is true there will be no time then to go back and begin her own education afresh upon a different basis—no time to take up deeper studies, and more solid attainments—no time to acquire even the elementary portions of that knowledge which she will sadly feel the want of as her children grow up; but there is still left her both time and opportunity for taking up many useful things—many right views of human life, and many means of improvement to herself, and instruction to her children.

Amongst these we might include just views of human life in general, of the relation of different members or classes of society to each other, of the mutual dependence and obligation of rich and poor—workers and non-workers—of the employment and economy of time, of individual responsibility, of self-government, and above all, of the relation of the human soul to God, of the observance of his holy laws and the acceptance of his blessed gospel of salvation by Jesus Christ. To these might be added innumerable other matters—questions of apparently minor consideration, yet all bearing upon human life in its relation to eternity, in which, if the mother can teach her children aright, she will be doing them greater service than by instructing them in all or any of those branches of learning which are made most prominent in schools.

There is a science of life, which women are quite able to understand without being great scholars. This science presents itself under many aspects. One embraces that true and just relation of human beings to one another which we call social duty. Another takes

in the law of kindness, with its natural reciprocities of good will, without which we cannot, as social beings, live happily, nor even prosper in our worldly affairs. Another comprehends that true estimate of the worth of things visible and invisible which leads us to consider one great and another little, one honourable and another base, one to be desired and another abhorred, and this according to their essential nature and value, through all the gradations which separate their two extremes.

To keep always before the mind of a child this truth—that certain things are great and others little, but beyond and above all other teaching, that certain things are good and others bad, and not so in the estimate of human beings only, but good in the sight of God and approved by him, and bad, as by him utterly condemned—good for ever, and bad for ever, according to his own immutable law of right and wrong; and so to train a child that it shall love the one and hate the other, is, I think, to teach it the true science of life.

And this the mother can teach to her children as no one else can, having first learned it truly herself. But it requires to be taught earnestly, perseveringly, prayerfully. It requires to be taught at home, and to be commenced with very early, because there is in the world, towards which the child is tending, so much that is calculated to throw the whole matter into confusion. There is evil which is called good, and good which is called evil; greatness which is looked down upon, and meanness which is exalted. How is a child, not rightly prepared, to understand this? Nay, there is reason to fear that doubts will ultimately press upon the mind of the child as to whether there are such things as true greatness and real goodness at all—whether these are only names applied to certain conditions of worldly prosperity or success, without any essential value in the things themselves.

It may be said by those who read human life in words and names, and not in essential realities, that doubts of this kind do not enter the mind of youth; that youth is more apt to believe and trust. Let us thank God that it is so, that the educator of the heart of youth has elements of truth and sincerity and honest belief to deal with, and not the querulous uncertainty of worldly calculation and consequent unbelief. That such is the nature of youth we have indeed cause to be thankful, for there can be no greater help, no more sustaining hope, than that the Giver of every good and perfect gift has placed in our hands material so capable of receiving right impressions from what is sound, and just, and true. But that youth does lose this natural bloom of its existence sometimes a little too soon, and does become worldly and disbelieving in spirit, though it may not be so in profession, I think no one can doubt who holds much intercourse with society in the present day. And assuredly there is no heavier calamity, either to youth or age, than that general indifference to high and holy truth which not unfrequently exists where a perfect horror would be expressed at the idea of unbelief.

We meet with this amongst the young chiefly under the form of irreverence, indifference, or disrespect; or, worse than this, it may be in symptoms of a mocking spirit—a spirit which is colder than ice, and harder than steel, against all those genial influences which are calculated to make the ways of life paths of perpetual verdure and refreshment, even to the weary feet of the long-experienced traveller.

In the course of these remarks, I have said but little on the subject of direct religious teaching, partly because a mother whose own heart is deeply impressed with

the supreme importance of a religious life will, in all things, teach religiously; and partly because our libraries abound with books written much better than I could write on this particular subject. Besides which, the more I see of human life, the more I feel convinced that the religious *atmosphere* of home is that which ultimately proves of the highest value and most enduring influence in forming the religious character of youth.

This atmosphere, like the air we breathe, I have considered as comprehending different elements, as deriving its wholesome and health-sustaining properties from various sources, and as being subject to deterioration from causes equally varied. Over this department I have regarded the mother as ruling by her own light; and as she would without doubt be considered responsible as regards watching over, and caring for, the healthy condition of her household, so in a higher degree, because the subject itself is higher, as involving interests of a more exalted range, so is the mother responsible for the right training of her children under such religious influences as it is possible for her to bring around them. It is true that she cannot, even in her own department, do always as she would—that she cannot do even what duty seems to demand, where circumstances combine against her, or where opposing influences arise, such as are stronger than hers, or more attractive to youth. But she can still do much; and if a faithful, earnest Christian herself, we know that she will not be left to bear the burden of responsibility unsupported, but that help, sufficient for her day, will be administered in all her times of need.

Were any other stimulus required for the best efforts of the Christian mother, I think it might be found in this—that never again, throughout the whole of her children's after lives, will the same opportunity be afforded as that which their infancy and youth have opened to her instrumentality. Many a troubled time and many a happy time there may be in their future, when her children will come back to her as their warmest sympathiser and their truest friend; but the morning dew will not be upon them then, as it was in their early youth—the flower will not be fresh, and fragrant, and spotless, as it was then; other hands will have touched it less gently than hers, and other breezes will have blown upon it very different from the breath of home. It is before the child has left the parental roof that such close union of heart and mind, such entire understanding of each other, can alone exist between the mother and her children, and especially between the mother and her boys; and where the soul of the mother is deeply stirred with a sense of the importance of educating for eternity as well as time, she will feel that her work must be begun early in the morning of youth, and begun upon principles that will hold good to the latest hour of a well-spent life.

DONKEYS AND DONKEY-BOYS.

WHAT is the nature of the connection which undoubtedly exists between the genus donkey and the genus boy we do not pretend to have discovered; though that there must be some sympathising link that binds them together, we gather from the fact that wherever donkeys are found the boys are sure to be found in intimate relation with them. Wherever donkeys are an institution, the boy is generally the director and administrator of affairs, and has the management of matters in his hands. The rule seems to hold good abroad as well

as at home: man claims jurisdiction over the horse and the mule, but is generally willing to surrender the more patient ass to his juvenile competitor. It is worth while noticing, by the way, the effect of this delegated responsibility upon the character of the boy; we may express it in brief by saying that it makes a little man of him at once. The urchin invested with office is sure pretty soon to change the sense of responsibility with a sense of authority; if he was timid before, he parts with his timidity; if he was bashful, he loses his bashfulness; and if he does not take up with a more than tolerable amount of impudent confidence in their stead, so much the better for those who have to do with him. We all know something, by report at least, if not by experience, of the Egyptian donkey-boys, with their dark faces and grinning teeth, of the clatter and din they make, as they yell and shout and tout for custom, and clamour for sixpences. "Give sixpence, ole gentleman always give sixpence;" and the responses they often get in the shape of a tough bull-hide descending on their bare shoulders, for which liberal allowance they care very little indeed, if travellers are to be credited, so long as there is a possible sixpence in perspective. But we must not suffer ourselves to be tempted into a discussion of foreign affairs: our business at present is with the home department of the subject, which will furnish sufficient matter.

The donkey institution with us divides itself naturally into two sections, that of business, and that of pleasure. In deference to a time-honoured maxim, we shall take "business first, and pleasure afterwards," treating of both heads with exemplary brevity.

Any one who would qualify himself for forming a right estimate of the part which donkeys take in the work of the world, would do well to pay a visit to Covent Garden market in the height of summer, when the summer fruits and vegetables are abundant, and hot and thirsty London is eager to have them. He should time his visit so as to be there before sunrise, and note what takes place between then and nine or ten o'clock. Should he need further evidence, let him go on the following day to Billingsgate and make investigations there. He will find in both places, and indeed in many other places in London, that the quantity of donkey-labour performed every day must be reckoned by thousands of tons of comestibles of one sort and another, and still more thousands of the long-eared quadrupeds whose part it is to lug them about the city and outskirts. The notion was prevalent formerly—so prevalent, in fact, that it came to be stereotyped—that the London donkey led a starved and persecuted life. Later investigations have shown that nothing can be farther from the truth: the starved London donkey is the rare exception to the rule, and the reason for that will be found not so much in the superior humanity of the London boys and lads who look after them, as in the fact that to ill-treat the animals does not pay. The ass is a profitable servant only in London streets so long as he is in good condition and able to do his day's work. Starve or wound him, and you may as well kill him at once, since if he is not up to the mark he will break down in the street. At the same time, and for the same reason, he is not over-fed. An ill-trained donkey will eat all day long if he has an unlimited supply of food, and will be capable of little work in consequence. Donkeys thrive best with a moderate allowance of proper food, and it is a fact that they are nowhere found in better working order than in London and its near neighbourhood. This was made sufficiently apparent at the late donkey-shows at the

Agricultural Hall, where, among the hundreds exhibited, there was not a single one bearing marks of ill-treatment, though most of them were in daily work, and where there were many capable of trotting ten miles an hour in a cart, and not a few that could do considerably more than that. There is a difficulty in providing for the London donkey the green food he should have occasionally, and it is often got over in a characteristic way by his youthful proprietor foraging for him in the suburban lanes and hedgerows, where he may be met with of a summer's evening cutting down the long succulent grasses that line the watercourses, and carrying it off in sacks. In the matter of stabling, perhaps, these public servants are not so well off as might be wished, rents being high. Where they are all housed at night it is hard to tell, though we know that some of them are littered down in area arches and cellars, and therefore have to go down-stairs to bed.

For the lean, angular, bruised, and more than half-famished donkey, one must look, not in London, but in the provincial towns and cities in the neighbourhood of sand-pits and coal-pits. Thousands of miserable asses pass their lives in carrying on their backs (not drawing in carts) small sacks of coal from the pit-mouth to the dwellings of the consumers. The price of the sackful, which weighs but a hundredweight, is less to the buyer by a full half than what it sells for in the town; but it sells so cheap that to make the journey pay, the poor beasts must be heavily loaded. They are met with in droves, sometimes of sixteen or twenty, all in charge of one lad, and wearily plodding with bowed head and ears bent back under loads of three to five sacks, according to their strength—the driver bawling “Coal, ho!” as soon as he comes in sight of a dwelling. A more ragged *cortège* it is impossible to imagine. The driver flutters in sordid rags; the hides of the brutes are torn into rags by the cruel friction of the sacks; the sacks themselves are often mere rags, being full of holes from which the coals would scatter along the road but that each hole is ingeniously corked with a lump too big to get through it. The policy of the driver leads him to lighten the loads of the weakest first; and when the whole of the day's cargo is sold, which is not until near sundown sometimes, he starts leisurely on the back track, suffering his disburdened beasts to crop the hedgerows by the way. During the summer they get nothing else but what they can pick up for themselves by the road-side or on the barren wastes on which they are turned at night. Not one in fifty of these anatomies could get through the day's work of a London costermonger's donkey, or could be urged to the pace at which they are seen trotting out of town on high days and holidays.

The sand-boy is proverbially jolly, and though the sand-boy's donkey is anything but a jolly subject, his is not such a deplorable case as that of the collier's luckless brute. The sand, if it is heavy, does lie softly on his back, and does not gall his poor flanks into painful and unsightly sores. Then he has more leisure, for as the sand-boy digs his own sand, and may be seen burrowing for it in a bank head-foremost, his legs only visible without, donkey can stand at ease, or graze while his master digs, and, making good use of his time, can pick up a passable living. The cry of “Sand, ho!” is generally heard in the town a full hour before noon, and is commonly accompanied by a succession of significantly sonorous thumps on the flanks of the animals, just to wake them up. As in the case of the coal, there is no return cargo; the only load the beasts have to carry back is the sand-boys themselves, whose characteristic jollity usually breaks out when their staple is turned

into cash and their day's work is done. Then it is that they race with each other on the homeward route, “as jolly as sand-boys.”

In country villages and hamlets we sometimes find the donkey in clover, and see him at his very best. He is the pet of the small farmer's wife, and draws her dairy produce to the market, where he rivals the pats of butter in plumpness. Or he is some well-to-do dame's substitute for a pony, and, glorious in japanned harness, glittering with buckles and studs of imitation silver, is driven out in the low four-wheel to pay morning visits. Or he is the property of the parson's little daughter, who humours him and allows him to have his own way, and only makes a show of beating him when the seductions of a fine juicy thistle draw his nose into the hedge and bring him to a standstill: and in either case he is sure to be the special charge of some boy whose pride it is to turn him out in spruce trim, and who exacts a wild gallop out of him now and then when opportunity offers.

Of the miscellaneous class of donkeys which turn up wherever one goes, and which belong to pedlars, tinkers, gipsies, hucksters, and vagabonds of all denominations or no denomination at all, there is little remarkable to be said beyond the fact that they have the ugly knack of getting into the parish pound, where they run the risk of famishing before their owner thinks it worth while to pay them out. In this luckless position they afford an admirable lesson of patience in misfortune, bearing their imprisonment and forced abstinence with far greater equanimity, it seems to us, than would their owners, for whose default they are vicarious sufferers.

But if the career of the donkey is suggestive of hard work, of privation, of neglect and suffering, it is also emphatically suggestive of pleasure and enjoyment, of seaside rambles, of forest picnics, of mountain-climbing, of rural excursions, and of holiday dissipation in all its phases. And this brings us to the other section of the subject, that of pleasure. Wherever we go in search of recreation when the vacation comes, there is the donkey, and there is the donkey-boy with his sandy smock, his sunburnt face, his cudgel of office, and his sharp eye for the coppers. Look at the pair on Ramsgate sands, for instance, as they skirt the edge of the tide when the breakers come tumbling in and the foamy ooze swirls up beneath their feet. Donkey, if you could see him, may be as ragged as a whole ragged-school, as scarred as Munchausen, as old as Old Parr, and as lean and bony as Rosinante—but you can't see him; all these hypothetical shortcomings are covered with the white robe of innocence in the shape of a linen cloth, which envelopes him from shoulder to crupper. He knows there is an urchin on his back greedy for a gallop, or at least a trot; he knows that Bob is behind with that stout cudgel, but he is too sagacious to “put that and that together” and mend his pace accordingly. Obstinate! do you say? not a bit of it—why obstinate? He is merely philosophical: he has gone through all that before, you see, perhaps a thousand times, and he knows that if he were to be so insane as to gallop at the instigation of the cudgel, that youthful appetite on his back would but grow with what it fed on, and there would be no end to his galloping or cudgelling either. No! he plods on as he has done any time these twenty years—he knows that Bob knows what is to be got out of him, and what isn't, and that his rider is fast coming to the conclusion to which he is bound to arrive, viz., that he (donkey) will go his own pace, and that “it is no use knocking at that door any more.” To say the truth, though Bob is liberal in demonstrations, out of regard

to the baksheesh, he is considerate in laying on, not only because he has no wish to increase his own speed from walking to running, but also out of regard for his old dumb companion and fellow-labourer.

When bound for inland excursions the seaside donkey works under higher pressure than he does upon the sea-marge; still he seems to relish the change from the soft wet sands to the hard dry road, and at times will even break out into a trot as if to show his mettle. When harnessed with a yokefellow in a light carriage, he has a tendency to run into the ditch either to right or left, and if his companion is of the same mind, into the ditch he goes twice or thrice in a mile, when the equipage has to be pulled out and start afresh. This disagreeable contingency, however, may be obviated by yoking two of the long-ears of opposite tendencies together, so that they may counteract and in a manner balance each other—a policy, we imagine, applicable in other cases besides donkey-driving, and worth resorting to for the sake of avoiding the extremes of party.

As a coadjutor in picnic excursions, donkey is often indispensable, especially when the route boasts no practicable road for a wheeled carriage. Then he carries a pair of panniers in which are stowed away the jars, bottles, pies, loaves, biscuits, the kettle for cooking, with the knives, forks, dishes, and et ceteras not to be done without on such occasions. Marvellously pleasant it is, when the weather is in laughing humour, to unbend and give a loose to the frolic of the hour amid the cool shadows of the greenwood; only, let us impress a word of caution on madcap parties bent on such indulgences. Be sure you tie up the donkey, that he may be forthcoming on the return journey. From want of such precautionary measure, it happened this very last summer that a party of picnickers had to load themselves with their own baggage, pots and all, on their return route—Mr. Donkey having preferred to walk back unhampered, and quietly betaken himself home while nobody was caring about him.

Sagacious donkeys are to be met with at times on the breezy slopes of Malvern—sagacious, that is, in sparing themselves unnecessary trouble. You engage them, of course, to carry you from the base to the summit, and having settled the preliminaries, away you start; but about halfway up your steed surprises you by slipping out from under the saddle, and leaving you foundered midway with that between your legs; in which enviable position you have the pleasure of overhearing some complimentary criticisms from the spectators upon your elegant style of assmanship. If you take a carriage and pair, the pair may chance to conspire against you, and come to a deadlock far short of the goal, when you have either to sit there in durance, or to accept the boy's suggestion and walk the remainder of the distance. Equal sagacity, though we have heard it called by other names, is sometimes manifested by the much-enduring beasts of Blackheath, Hampstead Heath, Epping Forest, and other London-haunted localities. It is shown in perfection by the animal's taking to kicking, jibbing, shying, and even rolling, as soon as you have prepaid his hire, and continuing these peculiarities until you decide, as you very soon do, to have no more to do with him. How far this is due to his natural sagacity, and how far to the training of his owner—who in those resorts is not the genuine donkey-boy, but a sort of outcast of the gipsy race—we leave the reader to determine.

Here we shall draw bridle, not because we have exhausted the subject—for, as everybody knows, there need be no end to a chapter on donkeys—but because we have got to the end of our tether.

Varieties.

AMERICAN ANTIQUITIES.—At the meeting of the American Association for the Advancement of Science, recently held in the city of Chicago, many of the papers indicated considerable activity in the researches into the activity and character of the early races of men who inhabited America. Colonel Charles Whittlesey, in a paper on the "Geological Evidences of Man's Antiquity in the United States," maintained that four American races preceded the red man: first, the mound-builders; secondly, a race in the territory now called Wisconsin; third, a warlike race in the region south of Lakes Ontario and Erie; and, fourth, a religious people in Mexico. Pottery, arrow-heads, etc., have been found in conjunction with and beneath the mastodon and megatherium. Human remains have also been found during excavations at New Orleans at a depth of sixteen feet. Mr. Foster exhibited a copper knife found in New Orleans, which he believed was a relic of the mound-builders. A water-jug, surmounted by a human head, and a statuette of a captive, with his hands bound behind him, both from Peru, and evidently of extreme antiquity, attracted much attention. It may also be mentioned that the recent explorations of Mr. E. G. Squiers in Peru, and the curious photographs of ancient temples, dolmens, etc., which he has brought back, have renewed some old theories as to a connection in origin between the earliest inhabitants of America and those of the oriental countries.

MR. RUSKIN AND THE JEWS.—Mr. Ruskin recently wrote a letter addressed to the query, "Is England Big Enough?" in which the distinguished art critic made use of the following illustration:—"A youth at college loses his year's income to a Jew; but the Jew must spend it, instead of him. Miser or not, the day must come when his hands relax." Mr. Barnett, of Bowden, thinking this a blow aimed with needless severity at his nation, addressed a letter, which we find too long for quotation, to Mr. Ruskin, in the course of which he says:—"I do not for a single moment presume to question the authority of a gentleman of your high moral and literary reputation. I merely notice you drifting, free of animus, no doubt, into a practice savouring of the dark ages." We give Mr. Ruskin's brief rejoinder:—"Denmark Hill, August 12, 1868.—Sir,—Permit me, in reply to your courteous letter, to assure you that I had no purpose of suggestion injurious to your nation when I employed the word 'Jew' for 'usurer' in the letter you refer to. But you must remember that the Gentile prejudice which was appealed to, and rendered almost ineffaceable by the greatest of our writers, is founded not only on the history of your nation, but on the peculiarity of its law. For as the Jews are forbidden by their law to take usury of each other, but may take it of Gentiles, the fact of their ever taking it is virtually a profession of hostility to us, and eternal separation from us, which we are too apt, in thought, and sometimes in word, to answer with reproach. You are wholly at liberty to make any use you please of this letter. I am, sir, your faithful servant, J. RUSKIN."

THE CLIPPER RACE FROM CHINA.—This year the Ariel was the first of the competing clippers from China. The Ariel left Foo-Choo-Foo on the 28th of May, in company with the Taeping and the Sir Launcelot. She was built in 1865 by Messrs. Steele & Co., of Greenock, and is 853 tons burden. Last year the main struggle was between the Ariel and the Taeping. The Taeping arrived at the London Docks on the 14th September, and the Ariel on the 28rd; but as the former sailed from Foo-Choo on the 4th June, and the latter on the 13th, the Ariel claimed to have won in actual speed, doing the distance in 103 days against 104. In 1866 the Taeping did the distance (14,000 miles) in 99 days, entering the docks only half an hour in advance of the Ariel, and an hour and three quarters in advance of the Serica. From May 28, the day on which the Ariel started this year, to the 4th September, is 99 days.

COST OF A GENERAL ELECTION.—The actual expenditure has been roughly stated at two millions sterling, but the published returns, as presented to Parliament in the session of 1866, give it at rather over one-third of that sum. These, however, were very defective. They did not include the expenses of three counties and eleven boroughs in England, one county and four boroughs in Wales, one county in Scotland, and thirteen counties and three boroughs in Ireland. There was another serious omission, for in many cases the

elected members only published their accounts, and the unsuccessful candidates left the public in utter ignorance as to what they spent. Still, we may form some idea of the amount expended by giving the totals for each kingdom, as set forth in the official documents. They were as follows:—

England	Counties	£300,108 0 7½	£604,178 0 3½
"	Towns	304,099 19 8	
Ireland	Counties	44,768 8 5	69,372 4 8½
"	Towns	24,603 16 3½	
Scotland	Counties	32,244 12 1	40,987 16 8
"	Towns	17,743 4 7	
Wales	Counties	12,095 5 4	16,307 4 3
"	Towns	4,211 18 11	

Total..... £739,845 5 10½

Distinguishing the aggregate cost of the counties from that of the towns, the following is the result:—

Counties	£389,216 6 5½	£739,845 5 10½
Towns	350,628 19 5½	

From these figures it is seen that more than £300,000 was spent to obtain the 147 county seats in England; so that the average would be about £2,041. The average cost of the 320 English borough seats was £950. So many of the Irish counties furnished no returns that the estimated cost must necessarily be wide of the mark, but the official statements give an average of £700 for the counties, and of £630 for the boroughs. The average of county seats in Scotland was £1,075, and of burgh seats, £770. The average expenditure on a county seat in Wales was £800, and a borough seat £300. Taking the whole of the United Kingdom, and deducting the members for the universities, every seat in the present Parliament, according to the figures supplied by hon. members themselves, costs its occupant £1,135. Allowing at least £100,000 for the unpublished returns of 64 seats, and for the expenses of those defeated candidates who declined to comply with the order of the House of Commons, the cost of each seat is raised to £1,288.—*Daily News*.

OUR BISHOPS.—Dr. Longley is the son of a working barrister, who became a police magistrate; Dr. Thomson was the son of a country draper at Whitehaven, in Cumberland; Dr. Tait was a younger son of an Edinburgh writer to the "Signet;" Dr. Philpott was placed at Cambridge at the expense of a small evangelical society for privately assisting promising young men at the universities; and Dr. Jacob, the Bishop of Chester, was originally educated for the Nonconformist ministry at the Dissenting College at Homerton, when Dr. Pye Smith was the tutor, and Dr. Binney was his fellow-pupil.—*Record*.

ELECTIONEERING PATCHES.—As applied to politics, the fashion was wittily treated in the eighty-first number of "The Spectator" for June 2, 1711: and in this busy month of electioneering, it would afford some suggestive hints to turn to that paper and see the way in which ladies were enabled to proclaim themselves political partisans by means of party patches. The ladies who were in the Whig interest wore their patches on the right sides of their foreheads, and the ladies who espoused the Tory cause placed their patches on the left sides of their foreheads, so that it was easy to tell at a glance of what opinions the ladies were. Occasionally, however, a mistake would arise. "Rosalinda, a famous Whig partisan, has, most unfortunately, a very beautiful mole on the Tory part of her forehead, which, being very conspicuous, has occasioned many mistakes and given a handle to her enemies to misrepresent her face, as though it had revolted from the Whig interest. But whatever the natural patch may seem to insinuate, it is well known that her notions of government are still the same. This unlucky mole, however, has misled several coxcombs; and like the hanging out of false colours, made some of them converse with Rosalinda in what they thought the spirit of her party, when on a sudden she has given them an unexpected fire, and has sunk them all at once. If Rosalinda is unfortunate in her mole, Nigranilla is as unhappy in a pimple, which forces her, against her inclinations, to patch on the Whig side."

MR. DISRAELI'S ORIGIN AND CAREER.—There seem indeed to be singular mistakes as to the relation of Mr. Disraeli to Judaism. Some Jews censure him as an apostate, and urge his apostasy as an instance of tergiversation. Some Christians scoff at him as a Jew, with a singular disregard of all they owe to the Hebrew race. Now the fact is that—in plain English—Mr. Disraeli is neither an apostate nor a Jew. He was born of Hebrew parents. His father, Isaac Disraeli, the author, and his mother, a scion of the Basevis, were members of Sephardim Jewish families. His grandfather and grandmother indeed rest in the Portuguese cemetery at Mile End. Benjamin Disraeli was

admitted into the communion of Israel, but his father thinking fit to quarrel with his synagogue, failed to teach his child Judaism. One day, Rogers, the celebrated banker poet, happening to visit at Isaac Disraeli's house at Hackney when Benjamin was five or six years old, and regretting to find so intelligent a youth without religious instruction, took him to Hackney Church. From this event dates his absolute and complete severance from the Jewish Communion. He became a Christian, and a great genius was lost to us. It may be interesting to add briefly some particulars of his career. He was educated, of course, as a Christian at a great English public school. He travelled in the Holy Land at an early age and soon launched into a brilliant literary life. After having unsuccessfully contested Marylebone, he entered Parliament as member for Maidstone, where his abilities appear to have been early recognised by the late Lord Lyndhurst—who, by the way, married a Jewish lady. After many sharp skirmishes with the late Sir Robert Peel, he materially aided—probably guided—the late Lord George Bentinck in reconstructing the Conservative party, disorganised by the Free Trade episode; and at the death of Lord George became the leader of that party in the Commons. He served thrice under the Earl of Derby as Chancellor of the Exchequer, and succeeded in carrying a Reform Bill, under circumstances of extraordinary difficulty, which he probably overcame not only by his very brilliant eloquence and admirable shrewdness, but also by his remarkable coolness of temper.—*Jewish Chronicle*.

COST OF PAUPERISM.—The return showing the expenditure from the poor-rates on in-maintenance and outdoor relief in England and Wales in the half-year ending at Lady-day, 1868, states that it amounted to £2,626,466—viz., £788,351 for in-maintenance, and £1,838,115 for out-door relief, being an increase of 6.8 per cent. over the expenditure in the corresponding half of 1867. Owing to the absence of returns from some places it is probable that the real expenditure in both periods was nearly one per cent. greater than these figures represent. Wheat, flour, and bread were dearer in the half-year ending at Lady-day, 1868, than in the half-year ending at Lady-day, 1867; but meat was cheaper.

SHOEING HORSES.—A new system of shoeing horses has been introduced in France, and is favourably spoken of in the Reports of the last Paris Exhibition. Its inventor, M. Charlier, contending that the present shoe destroys the horse's foot, substitutes for it an iron band, let into a rectangular groove scooped from the outer circle of the hoof. This band is fastened by seven rectangular nails, driven into oval holes. The sole of the foot and the frog are thus allowed to touch the ground, and the horse never slips and never gets disease of the foot. The new shoe has been tried by M. Laugnet, a large job-master in Paris, and has reduced lameness in his stable by two-thirds. The Omnibus Company, moreover, have shod 1,200 horses, and speak of the improvement in high terms. In a report of the recent Irish Industrial Exhibition at Londonderry, we read that—"One of the most novel and useful inventions in the yard, though not included in the catalogue, was a horseshoe, exhibited by Mr. James Cooper, of Foyle Street, Londonderry. It is made to fit any sized foot, and is of a very permanent character, having the wearing parts, cocks and toes, suitable for draught or saddle, and it can be taken off or put on very quickly, without hammer or nails."

LONDON GENERAL OMNIBUS COMPANY.—The gross receipts of the company during the half-year ending June 30, 1868, were £284,780 14s. 6d.; in the corresponding period of 1867 they were £281,637 5s. 7d., showing an increase of £3,143 8s. 11d. The number of passengers carried in the half-year amounted to 20,313,821; in the same period of 1867, 20,667,301, showing a decrease of 353,480. Total number of miles run in the half-year, 6,046,180, against 6,014,868 in the corresponding half-year of 1867. The total expenses during the past half-year were £277,722 12s. 3d., of which "provender" cost £126,868; in the same period of 1867 they were £286,138 16s. 2d., showing a difference in favour of 1868 of £8,416 3s. 11d. The number of horses engaged in working the company's omnibuses on 30th June, 1868, was 6,724; at the corresponding period of 1867 the number of horses was 6,667.

ALBERT CHAINS.—Why do people wear Albert chains except to save trouble to the thieves? They could only have been invented in the interests of the pickpockets. If vanity induces men to wear them, could not the watch be detached, so that only the chain would be lost? The wearer's vanity would then be gratified and the watch would be saved. But are grown men still so silly as to wish to display a few ounces of gold upon their waistcoats?—*Times*.

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper.*

THE MEETING INTERRUPTED.

THE EXILES OF SALZBURG.

CHAPTER XI.

ABOUT ten months afterwards, in the latter part of the autumn of 1730, a knocking was heard at Peter's door. "Come in!" cried he, without looking up from the book with which he was whiling away the time, and which contained some very beautiful wood-cuts of the seven wonders of the world.

With hat in hand, Hans Weinleidtner stepped into the room, his countenance expressing timidity blended with cheerfulness.

"What art thou bringing, Hans?" said Peter, squinting at him.

"The best respects of father and mother Manlicken, as well as those of my——" "Wife," was upon his tongue, but he restrained himself as though he had not actually married a wife. After a little hesitation, he added, "My Barbara, and also——" here he again paused, "another father."

"What other father?"

"Myself," replied Hans, bluntly, and blushing with joy, whilst he twirled his hat round his hand like a potter's wheel.

"Aha! is it a boy or a girl?" said Peter, showing genuine satisfaction.

"It is a boy," said Hans, simpering.

"Is the little one quite well? What name wilt thou give him?"

"Peter—thy name," replied Hans.

"Pho! by no means do that. It might shame the boy to bear resemblance to me. Why hast thou called him after me? Didst not thou recollect that I was lame, squinted, and had a shock of red hair?"

"Certainly not," protested Hans. "We remembered only 'the good Peter,' whom we have to thank for everything."

"Ah! do not mention that. Hast thou chosen the sponsors yet?" inquired he.

"Yes," said Hans. "We have chosen two, and thou wilt be the third."

"Very well," sighed Peter. "But who are the other two?"

"Manlicken and his wife."

"Better and better still; all of the family. But I fear that the priest who once refused to marry thee will also refuse to christen the child."

"He has done so," said Hans, "though to please Barbara I have been entreating him to do it."

"Then what dost thou now intend to do?" inquired Peter.

"We must have a private christening at home," said Hans, thoughtfully. "I have a little book of the Reverend Doctor Luther, called the Smaller Catechism."

"I know it well," said Peter.

"In this book," continued Hans, "there is an exact account of the manner in which a child is to be baptized. So I will christen my boy myself. The smith at the Hutten has done the same: and the priest, who would have allowed my child to grow up a heathen, will have to answer for it. What I may want in the form of ceremony I shall make up for by excess of fatherly love."

"Hans!" said Peter, deeply moved, "thou art a good fellow, and as judicious as if thou hadst seen as much of the world as myself. If that odious Father Grinselm were to have baptized thy young one I do not know whether thou wouldst have had me for a godfather, so much do I hate the miser; but as it is I am ready at any moment. What time hast thou fixed upon?"

"The Sunday after next," said Hans, who now, bidding Peter farewell, hastened back to Barbara and their little son.

Manlicken, however, soon disturbed the happiness of the family by the information that he and twenty-two others of his townsmen had resolved to go to the Emperor at Vienna, to lay before him the complaints of the oppressed people of Salzburg, and to implore his intervention in their behalf. All they required was to enjoy the free exercise of their evangelical faith, which the Treaty of Westphalia granted to every one in the German empire, or else to obtain permission from him to emigrate into some other country.

"Do not try to dissuade me from it," he said to Catherine, who was in tears. "It is a sacred and noble duty, to which I am appointed by sixteen hundred and fifty souls of this district alone, who are crying out for help. Did not Moses, for a similar reason, once forsake his peaceful home? Thou fearest danger for me, imprisonment, or even death; but may not death surprise me also in my bed—in the bosom of my family? Have I not already suffered innocently? God's will be done," ejaculated he. "Besides, I do not leave thee helpless. Are there not eight arms, large and small, to labour for

thee? Is it not so, Barbara, Joseph, Hans, Frank? Thou wilt all act in my stead towards thy mother? Cease weeping, and smile as I do, although I think the smoke does make my eyes smart a little."

And truly, though he did force a smile, it was in the midst of tears which he endeavoured to hide. He then took leave of his family, and departed from the cottage, unaccompanied and unburdened, on account of the spies who were about. In the same manner his associates, twenty-two in number, stole singly across the frontiers, in confident hope that they should be out of all danger when once they stepped upon Austrian territory.

CHAPTER XII.

THE moon, in her last quarter, was gradually sinking behind the mountains; brightly shone the stars in the deep blue vault of heaven; darkness and peace rested on the valleys in which the cottages, with their inmates, lay hushed in still repose. Here and there a solitary linnet was twittering his melodious song; the graceful deer were timidly reconnoitring from the outskirts of the forests, before venturing to descend into the cornfields, which waved in full luxuriance in the plains beneath. The quiet landscape, however, was not so entirely destitute of human life as it at first sight appeared. A number of men, forming a long dark file, stepped barefooted along the narrow path which wound by the bank of the torrent rushing impetuously between the mountains and valleys. They were carefully seeking the soft grass, that their progress might not be betrayed by any sound which might rouse the slumbering cottagers. From many a ravine and from many a mountain they were joined by similar processions, all having the same end in view. In this manner, perhaps, the Swiss might formerly have united when they determined to break the yoke of Gessler. A similar act it was the intention of these plain and simple people of Salzburg to achieve: it was only so far dissimilar that the difficulty was still greater, it being a spiritual yoke that they sought to cast off.

"Perhaps the holy father is studying," whispered one of the men to his neighbour, as he pointed to a window feebly lighted, which belonged to a large building, in the vicinity of which they used redoubled caution.

"Hush!" muttered the person, placing his finger on his mouth in token of silence.

Thus they proceeded for some distance, continually augmenting their number by new comers. At length they arrived at an isolated house built on the declivity of a mountain, and to all appearance deserted, which received the travellers within its gloomy gate. But in the interior a brilliant light, which was prevented by shutters from being visible outside, welcomed the guests upon their entrance. The spacious parlour, which was crowded to excess, resembled a beehive, filled with the dark forms which dared only converse in whispers.

At last a side door opened, and an aged man of a most venerable appearance entered, carrying a Bible under his arm. Great calmness and evident contentment, the result of religious conviction, were visibly impressed upon his countenance, as he, in a quiet and friendly manner, passed through the multitude to a small space which had been cleared for the purpose of worship, and there placed himself in an elevated seat. Having laid the Bible upon a table placed there for the purpose, and having waited till complete silence was obtained, he began in a subdued tone of voice the following address:—

"May God the Father, God the Son, and God the Holy Ghost reign in our hearts and minds! Amen."

"Amen," piously responded the whole congregation. "When two or three are gathered together in my name," saith our Saviour, 'I am there in the midst of them.' Wherefore, let us hope that he will now be amongst us, who are here assembled to praise and glorify his name. Yea, let us praise him that he hath revealed to babes and sucklings what hath hitherto been hidden from the wise and learned of the earth. Verily his Spirit manifestly resteth upon us, a flock without a shepherd—without a visible shepherd I mean—for he is the Good Shepherd who laid down his life for us. A great thing hath he done for us poor ignorant people, that he hath permitted us to know and acknowledge his holy word, in which no one instructed us, which we hardly dare read. Only in secret, one of us, here and there, could consult it in order to derive from it consolation and comfort. Outwardly we all practised the ceremonies which the Papal Church commanded. Our mouths uttered words which were foreign and repulsive to our hearts. Thus it happened: our knowledge was yet weak; our faith was yet mingled too much with the fear of man; and care for temporal things still engrossed too much of our thoughts. But the divine word resembleth truly the grain of mustard-seed, which by degrees became a large tree, under which thousands of us joyfully assembled. Vain were the efforts of our adversaries, who strove to prevent the growth of the goodly seed. Strange priests were sent into our valleys to re-convert us: curses and imprecations were showered down upon us and our faith from the pulpit. We strove to shun them, and had to atone for it by paying heavy fines. The Jesuits intruded into our peaceful dwellings, ransacking them in search of our holy books, which we hid in hollow trees, beneath a movable plank in the floor of our dwellings, and in other secret places, to conceal them from their rapacious eyes. The scripture saith, 'Lo, the devil will cast some of you into prison, that ye may be tried.' In us, as of old, this text hath been fulfilled. Ye have proofs of it in Hans Lerchner, Veit Bremen, Ruprecht, in the seventy-third year of his age, and in Winter, who, although dangerously ill, was loaded with fetters, dragged a distance of some miles from his home, cast into a dungeon, tortured, and at length fined one hundred florins, for no other reason than he had been seen reading 'Luther's Family Expositor.' Eleven other persons, for a like case, after an imprisonment of four weeks, during which period they suffered hunger and cold, and other severe inflictions, were forced to pay seven hundred florins. Even our children were taught by the priests to become spies and informers against us, and were thus estranged from their parents. But for this reason, I say unto ye, be ye faithful unto death, so shall ye receive the crown of eternal life. Men of courage from amongst us have already laid our just complaints before the ambassador of the Protestant princes at Ratisbon. They have not been unheard. We may rest assured of their powerful protection. Three-and-twenty brave men are gone to the emperor with petitions signed by many thousands of their brethren in the faith; assuredly our noble emperor, Charles the Sixth, will aid us. Two more have also gone to the supporters of our faith, the Kings of Prussia and Sweden: we are anxiously awaiting their return, and the answer they bring us. Meanwhile let us seek to edify ourselves by reading the holy gospel, which is the power of God, to—"

"Hark, there is a knock!" said several voices, interrupting Antony Wallner. Instantaneously 'the burning torches which lighted the room were extinguished, and concealed behind the immense stove.

This done, the owner of the house called aloud from the window, on the outside of which the sounds had proceeded, "Who knocks?"

"Open the door, Rothenbacker; it is I, Nickel Strenger."

At this answer the men within again breathed freely, the torches were relighted, and the new comer heartily greeted.

The latter, however, said, almost breathlessly, "Have you heard yet what has occurred to George Frommer?"

"What has happened to him?" cried they, all together.

"Last night," he replied, "he endeavoured to make his escape from the castle of Werffen, for which purpose he broke through the iron grating of his prison, and let himself down by means of his shirt, which he had twisted into a rope."

"Well?" eagerly inquired they.

"His design was unfortunately discovered, and he dislocated his thigh by jumping down part of the height."

"Poor George!" they all exclaimed.

"In addition to all this," he continued, "the Warden was desirous of seizing by force a peasant's daughter, and not satisfied with that, wished to part the mother from her child, and make a servant of her at the castle. She is the daughter of the same Manlicken who—"

"Oh!" A sudden cry showed that Hans Weidleitner was amongst the assembled company.

"Wait a moment," said the proclaimer of evil tidings, restraining the frantic husband; "wait a little, thou hast not heard the best part of it yet. She did not suffer herself to be taken, for seizing the coulter of a plough, she threatened to kill the first who laid hands on her; and, at all events, said she would rather kill herself than part from her child. And thus at last the Warden was compelled to leave her, to the great displeasure of the priests, on whose account alone the whole affair was undertaken."

This tranquillising explanation, however, was insufficient to prevent Hans from now abruptly leaving them. In the darkness by which he was surrounded, and the anxiety which overcame him, he ran headlong against a man, who, through the violence of the collision, let go his gun, which fell to the ground. A hearty kick with his foot set Hans free from the hands which had immediately grasped him, and before his unseen foe had time to recover his gun and fire it after him, Hans had disappeared.

Loudly the mountains re-echoed the report. At this sound, together with the shouts of a number of men who had surrounded the house on all sides, Antony Wallner, with his accustomed calmness, began to appease the minds of the terrified congregation.

"Fear not, thou little flock; let us at once learn our fate, even though we should all have been betrayed."

"Open the shutters," cried an authoritative voice.

The instant the command was obeyed, three or four muskets were thrust through each of the windows, and with the click of their locks there was heard from a number of throats the rough cry, "Surrender, or you are all dead men!"

"For all that we have done," answered Antony Wallner, "we can answer to God and man. Put back the sword into its scabbard," he said to some of the more courageous, who seemed inclined to make resistance.

Submissively and without murmuring, he and thirty-three of the most prominent of the assembly suffered themselves to be bound, and were thus conducted to the castle of Werffen.

The rising sun found the remainder still assembled—undetermined, giving and rejecting counsel. There were many who advised having recourse to force, others to money. As soon as the report of this act of violence was known, many more of the inhabitants, who were bound together by the tie of the same faith, and conscious that the danger of the prisoners was also their own, assembled together to consult upon the best means of securing their safety. The house was now filled with a multitude of brethren of the same religious faith. Some rash and intemperate persons, heated with zeal, inflamed their discontent, and immediately weapons were grasped with the intent of opposing force to force. The multitude had already begun to move towards the castle, when the arrival of two travellers covered with dust occasioned a delay.

The names of Peter Heldensteiner and Nicolas Forstreiter passed from mouth to mouth. Many a powerful hand grasped those of the new comers in token of welcome. As a foaming cataract which, having abandoned its rocky bed, gradually losing its tempestuous rage, is seen flowing gently along, murmuring between alder-trees, so did the wrathful tumult of the multitude now subside into perfect stillness.

"Relate, relate," cried a number of voices. The two men nodded assent, and repaired to an eminence, around which all the people arranged themselves.

"We were in Ratisbon," began Heldensteiner, whose powerful voice proclaimed him to be the present orator. "There is much writing backwards and forwards on our account among the Protestant ambassadors; but nevertheless our sovereign does what he pleases, and not what is right and just, according to the articles of the Westphalian peace. We therefore thought it best to betake ourselves at once to an upright master. In Cassel we related our business to the Swedish ambassador, who, every time we saw him, expressed his willingness to provide for such of us as were skilled in iron works, mining, and smelting. But as that would not suffice us, we therefore proceeded to Berlin, to the great Frederick William. The people there must have heard strange things of us. They could hardly believe that we were Christians. In the first place, we were obliged to submit to a long catechising before two spiritual chiefs or metropolitans, whom they call provosts. We may well remember their names, Roloff and Reinbeck, for they almost tormented us to death with their questions: as, for instance, in how many Gods we believed; whether we had acknowledged Christ; if we knew the principal articles of the Christian faith; and what books we had. We were much put to it, to be sure, but we did not remain in their debt by the answers we gave. At last, when they found us so well versed in the scriptures, they became quite friendly, and did us great service; for they procured us admission into the king's presence. We were not only permitted to see his majesty, but even to speak to him."

A burst of glad astonishment now arose from the quiet and attentive audience; a joyful murmur like the bubbling up of a fountain was heard throughout the assembly, who again turned with deeper attention to the now envied Heldensteiner.

"Yes," continued he, his bosom swelling at the recollection—"yes, the mighty monarch who reigns over millions more subjects than our prince-archbishop, spoke to us poor men. At first, to be sure, we were quite dazzled and bewildered. But then he encouraged us in so kind a manner, and put so many questions to us, that at last we quite lost all feeling of awkwardness, and answered him fearlessly. The good king—God

bless him for it!—told us, when he found that we were honest people and true Protestant Christians, that if we were compelled to abandon our native country, he was willing to receive us all, and to grant us lands, cattle, and habitations. That is what the good king said."

Tears of joy now moistened many a furrowed cheek, and blessings were invoked upon so gracious a monarch.

"But," began one of the assembly, "shall we find our mountains and Alps in Prussia? What sort of country does the good king govern?"

This question was so deeply felt in the breasts of all present, that every look was directed in anxious expectation to the lips of the interrogated. All eyes followed those of Heldensteiner, as the latter glanced around him to form in his mind a comparison between his own country and Prussia.

"Speak!" they at length exclaimed.

Heldensteiner gazed upon the multitude with a peculiar expression, and then mournfully said,—

"No, my friends, nowhere shall we again find our mountains and Alps, our valleys and waterfalls. Vast plains, extending as far as the eye can see, and covered with sand, or dark gloomy forests, constitute much of the land which belongs to the great king. Even his beautiful capital where he resides is built on a plain of this description."

The impression produced upon the assembled multitude by this answer defies description. With evident sorrow all eyes were bent to the ground. Deep silence prevailed for some moments, unbroken save by heavy sighs. Ah! they had never till now understood or felt how dear to them were the mountains of their beautiful Father-land!

For a considerable time Heldensteiner and Forstreiter seemed to share in the grief of their countrymen. Forstreiter at length said:—

"There was a man who found a treasure that had been hidden in a field, on which he went home, sold everything that he possessed, and bought that field. Again, there was a merchant who sought for a costly pearl, and when he had found it he sold his all and purchased that pearl. We have found a treasure, and a pearl, dear brethren—our beloved gospel!—well then, let us sacrifice our all for it."

On the faithful minds of the true-hearted people this scripture parable had quick efficacy; every one felt a deep conviction of its application to themselves.

Availing himself of their present disposition, Heldensteiner once more continued:—

"Did not the Israelites of old forsake the flesh-pots of Egypt, its melons, and cucumbers, and the fat herds of the land of Goshen, and wander for forty years in the burning sands of the Arabian wilderness, in order to escape from the bondage of the Egyptians? And here, you see, is a bondage from which we would escape still more intolerable than the enthrallment of the body. Of what use to us are mountains and valleys? of what avail are Alps and meadows where treachery, persecution, and spies beset us? As a good King Pharaoh in the days of yore showed Jacob the land of Goshen, so will the good King of Prussia grant us a land where our cattle will find green pastorage, though, alas! no Alps. Long live the good king!"

"Long live the good king!" was loudly re-echoed by all.

"Let us now await the answer which our deputation will bring from the emperor, and until then let us patiently abide the events which may happen," said Heldensteiner.

"And Antony Wallner, and the other prisoners?" inquired the crowd.

"Let us include them in our prayers, and commend them to the protection of Him who sent his angel to free the apostle Peter from the prison of the cruel Herod."

At the conclusion of this speech the multitude dispersing, returned peacefully to their homes.

CHARACTERISTIC LETTERS.

COMMUNICATED BY THE AUTHOR OF "MEN I HAVE KNOWN."

WILLIAM BLACKWOOD, THE PUBLISHER.

It has been said that since noblemen ceased to give and authors to take douceurs for eulogistic dedications, publishers have become the only patrons of men of letters. This dictum, though on high authority, I take to be sheer nonsense, as it is generally understood and glibly repeated. To ask or expect publishers to be patrons in the common sense of the word, or to say that they are so, is much the same as to call a grazier the patron of his herds, and prone to nurture them at all risks for the pure benefit of the public. Acting on this principle, publishers would soon cease to be patrons, or to exert any other useful influence in society. It is true, nevertheless, that publishers, in the way of employing their capital, do possess great power, by the judicious exercise of which they can not only essentially serve the interests of meritorious writers, but do much to promote the cause of wholesome national literature. A publisher, fairly educated, and endued with the rare gifts of good taste and sound judgment, who superadds the management of a magazine or periodical to his ordinary business, is in a position peculiarly favourable to be of service to literary aspirants, and to promote the best educational interests of the country. He has opportunities of seeing early efforts, of forming opinion of capacities, of encouraging promise, and, to some extent, of rewarding as well as fostering true merit; in short, of removing barriers which too often preclude even genius and industry from entering the tempting field of letters, and admitting the rightful votaries to enjoy "the pastures ever new."

As a leader and representative of this class of publishers, William Blackwood, of Edinburgh, was a perfect example—an example now followed by a number of London publishing houses in form, and it may be in spirit. Like Old Cave, in the "Gentleman's," so many years ago, "Old Ebony" was always on the alert to advance the progress of "ma (my) magazine." He gave cordial encouragement to the first essays of writers, who have since risen to great eminence; and whom he once adopted he never deserted, but stood a steady friend through good report and evil, till time should more or less confirm the justice of his appreciation. On the retrospect it must be allowed that his critical acumen was of a high order; and whether as the introducer to the world, or cherisher in their career, of such authors as Pringle, Galt, Lockhart, Wilson, the "Ettrick Shepherd," Samuel Warren, Dr. Croly, Moir (Delta), Caroline Bowles, Maginn, Aytoun, Alison, and many more, including the great Wizard himself (notwithstanding his furious letter and passionate tiff with the publisher for daring to criticise his "Black Dwarf"), he largely encouraged talent, and struck out valuable paths in national literature.

I abstain from notice of the questions of acrimony, personality, lampoon, or other vices alleged against the Magazine by controversialists on opposite sides; much

of it was the language common to all parties in those days of "pot and kettle," when people were really more in earnest than they are now. We gladly acknowledge a better tone in the press, and that there are far fewer outbursts of foul words, misrepresentations, and violence. For this we must be thankful. The system of abusing adversaries has happily been moderated, and we can no longer truly say of the upper sort—

"Scold answers foul-mouthed scold,
Bad neighbourhood I ween."

But I have penned this introduction not to discuss literary points, but to exhibit something of the character of the individual, as it accords with his correspondence, as he pushed forward with his hobby—for such it was. It was not mere trade. He was strong and honest in his opinions, and indefatigable in giving effect to them. Outspoken and independent, he had no rancour, and only very short-lived resentment, against opponents; and to "ma contributors and friens" he was friendly to the extreme. Yet there are so many rather private matters in his letters that they can very imperfectly corroborate my view of his character. His interest (nothing sordid) in the success of the Northern press was always wide awake.

Edinburgh, 21st Dec., 1824.

MY DEAR SIR,—I send you an early copy of the new number of our friend Brewster's journal. I hope you will find several curious and interesting matters worthy of noticing or extracting.

I flatter myself that you will have a favourable notice of my friend Delta's elegant volume, which I had lately the pleasure of sending you.

I am, my dear Sir,

Yours very truly,

W. BLACKWOOD.

W. Jerdan, Esq.

Edinburgh, 25th Nov., 1833.

MY DEAR SIR,—I cannot send off the "Magazine and Journal of Agriculture" without thanking you for the kind help you have given to "Tom Cringle." The sale, I am happy to say, has been very great, and fully justifies all the praise the work has received.

I am, my dear Sir,

Yours truly,

W. BLACKWOOD.

These are but samples of his perpetual solicitude to keep moving. The next is rather curious: the "Edinburgh Review" had animadverted unpleasantly on the "Literary Gazette,"* and provoked a reply.

Edinburgh, 4th April, 1828.

MY DEAR SIR,—I congratulate you most truly upon your capital castigation of the Blue and Yellow. I never in my life read anything so well done, or that I more fully agreed with the justice of the punishment inflicted. It is really surprising that a person of Mr. Jeffrey's talents and tact should allow his journal to be disgraced with such trash of puffery. You judged well, too, in seizing upon the "Edinburgh Review" as the best way of repelling the attacks of the ephemerals.

I have the pleasure of sending you an early copy of "Mansie Waugh," with which you have already got acquainted in mags. My friend Mr. Moir (Delta), who is the author of this amusing volume, is one of the most amiable and worthy persons living, and I feel most deeply interested in the success of his book. You would, therefore, oblige me very much if you would do what you can for it. In queer, odd Scotch manner and incident, many parts are equal to Galt, and perhaps touched more delicately. I need not say, however, that if it should not please you, as it does me, I do not for a moment expect you will favour it; but if you do not like it, which I should regret, I hope you will pass it over.

I am, my dear Sir,

Yours very truly,

W. BLACKWOOD.

W. Jerdan, Esq.

* N.B.—Its editor has been a contributor both to the "Edinburgh" and "Quarterly."

The drollery of this is Blackwood's charge against Jeffrey, as if unconscious of the abuse lavished on himself by the bitter political opponents of his creed in Edinburgh, and re-echoed in London. Well sung Burns—

"O, would some Power the giftie gie us
To see oursels as ithers see us,
It would——"

What would it not do?

My next, though of a year's earlier date, shows the real interest he felt in the welfare of the "Shepherd."

MY DEAR SIR,—I am just favoured with your kind letter of 30th April. I am truly sorry that our worthy friend The Shepherd does not fall within the class to which your Society* gives pensions. If, however, great originality and true poetical genius could have given any title, sure I am there could not be so strong a case as our friend's for the Society's extending their patronage.

I feel much indebted to you for your most friendly offer of moving for a draft of £50. This, however, is a matter of some little delicacy, and though for my own part I think our friend would most gratefully accept a favour so delicately and honourably conferred upon him, yet I do not like to take it upon myself to say so. I intend, therefore, to consult some mutual friends here, and will write you in a few posts.

In another letter I find the canon of reviewing on which the Magazine was edited plainly laid down, and as it may still be deserving of attention in similar periodicals, I do not hesitate to give it a place:—

Edinburgh, 22nd Feb., 1830.

MY DEAR SIR,—I was favoured with yours on Saturday. I assure you my memory did not require a jog with regard to your friend Mr. Roby's splendid and interesting work.† So soon as I read it, I put it into the hands of one who is most capable of writing an article creditable both to your friend's book and the mag. He is, however, a person who must take his own way, and will only do things at his own time. Much, many of my own publications have suffered from being either unnoticed altogether in maga., or noticed after the proper time was gone by; but I have laid it down as a rule never to urge any of my friends to notice a book unless it is their own free will to do so, and that they can make an article which will be worthy of maga.

As to your fair friend L. E. L., I have only to repeat what I have told you with regard to Mr. Roby. All the same, you must have observed how kindly she is mentioned whenever there is incidental occasion for it.

You are too old a man of letters to mind a little nibble of an occasional writer in maga. You may rest assured that all these friends, on whom I rely principally for the support of maga., think most kindly of you, and I hope in an early number there will be an expression of this, with regard to your "Foreign Literary Gazette," etc.‡

I am, my dear Sir,

Yours very truly,

W. BLACKWOOD.

W. Jerdan, Esq.

With the close of another epistle of a two years' later date, and within two years of the writer's death, I conclude:—

Edinburgh, 26th Oct., 1832.

MY DEAR SIR,—By-and-by an advertisement will be sent to your publisher of the proposals for publishing by subscription our friend Allan's admirable picture of "Sir Walter in his Study." You will see what is so justly said of it in the "Noctes." A word from you goes a great way, and I am sure it will not be wanting. The advertisement is in my advertising sheet.

I am, my dear Sir,

Yours very truly,

W. BLACKWOOD.

* The British Society of Literature, of which I was a zealous promoter, and long upon the council.

† My friend Roby's "Traditions of Lancashire." Poor Roby! He left a sad tradition of himself, being killed in the wreck of a vessel between the Mersey and the Clyde.

‡ Lasted thirteen weeks, and cost thirteen hundred pounds.

Here we meet with one proof of many that it was not self-interest alone which sustained the writer's unflagging activity. He was ever watchful to serve a friend as well as to advance the interests of his magazine. If we look back upon his era it must be acknowledged (whilst others worked worthily and well in the same direction) that the renown and profit of Scotland were far and wide extended by the impulse given to its press by William Blackwood.

A TRIP TO AILSA CRAIG.

1. GULL. 2. PUFFIN. 3. RAZOR-BILL. 4. CORMORANT.

EVERY tourist in Scotland, and every reader of Scottish story and song, is familiar with the name of Ailsa Craig. Every naturalist also knows that this huge basaltic rock is the haunt of countless sea-fowl, and especially of the gannet or solan goose. The narrative of a recent visit may interest the readers of the "Leisure Hour."

On a lovely evening in June, I sailed from Girvan, having obtained permission to spend two or three days on the island.

Two craigsmen, Hudon and Sandy, are on the beach waiting for us, and take my baggage up to the hut. I immediately start along the shore, if shore it may be called, for to leeward of the Craig, that is, on the Ayrshire side, is a raised heap of boulders of all sizes, piled up in alarming disorder, and forming a triangular raised beach. Happily there is a path which leads to the climbing-place, where the birds are swarming in

myriads, kittiwake gulls, herring gulls, razor-bills, guillemots, puffins, all sporting in the water, or flying, or sitting on the ledges of rock.

As I want some birds to dissect and some skins in good condition for stuffing, I ask if I may go up the face of the cliffs with the climbers. The two craigsmen and myself sally out, and walk along the path to the only place where any bushes grow, which are one or two stunted elder-trees. The ground is here very rugged; huge rocks seem hurled in confusion, of many tons weight, and moreover so sharp and slippery as to require very great caution in walking. And this is the commencement of the breeding-place of the sea-birds. High up above us on the cliff the razor-bills, puffins, and guillemots are sitting, and I am very eager to see their haunts. The climbing here is over the tops of the basaltic pillars and along ledges about a foot wide, with nothing to take hold of; but rubbing my stockings in earth helped me a little.

The nets are not unlike herring nets, long and tanned,

but with rather larger meshes. I can see the birds struggling in them, and a few cool and cautious steps bring me within reach of them. Three or four puffins are struggling in the meshes with their red sharp nebs picking at the net, and entangled in a curious manner.

HEAD OF PUFFIN.

I sit down beside them and clutch hold of a puffin, which gives me a sharp snap and draws blood. I catch the next round the neck and extricate it, and as its plumage is unsullied it proves a good specimen. Climbing to some more nets, which are simply spread over the rocks, and secured to the débris of rock on which the puffins roost, there are, in the craig parlance, several "strannies," or razor-bill auks. Having secured several in good feather, and collected out of the other nets the birds which twine themselves in the meshes so that it is difficult to extricate them, I have leisure to look around me.

HEAD OF RAZOR-BILL.

The rocks here are piled one over the other in great disorder; huge pieces, tons in weight, are just on the verge of the precipice, and around me the rocks are like basaltic columns in regular pillars, save where frost and damp have detached portions. The rock is of a fine grained basaltic texture, and takes a fine polish. It is largely used for making curling stones. The Craig is rented from the Marquis of Ailsa for that purpose, and for the sake of the sea-birds' feathers, the birds being sent to Girvan and surrounding places to be plucked.

Climbing to a convenient spot where there is plenty of standing-room, I wait for the climber coming, and examine the breeding-places of the birds. The puffin (*Fratercula Arctica*) and the razor-bill auk (*Alca Torda*) are the two birds that breed at this particular spot, and on every ledge, or projecting bit of rock near, a demure little puffin sits, quite tame, allowing itself to be almost touched by the hand without moving. They are flying past, one at a time, with great rapidity, within arm's length. The rocks around me are white with their excrement. Wherever a patch of earth is, between the shattered fragments of rock, there are the holes of the puffins.

The razor-bill auks are here in great plenty. In form and habits they greatly resemble the puffins, but they have black feet, a different shape of bill, and rather

bigger bodies. The eggs of the razor-bills and guillemots are exceedingly large for the size of the bird, and taper to a point so that they shall not roll off the narrow ledges. There are great quantities of razor-bills' eggs within arm's reach. The egg itself is generally of a whitish ground, very variously spotted and blotched; in some eggs there are thousands of minute specks of a deep brown, in others big blotches of a rich sienna, or speckles of a dark umber brown. Great quantities of the eggs were *clocked*, as we say in Scotland, *i.e.*, addled, or half hatched.

The divers, owing to their legs being placed so far back, almost close to the tail, have a peculiar odd way of standing straight upright. A row of these birds standing on the narrow ledges looks rather grotesque.

But, meanwhile, I see the climber, after visiting the other nets, tie the *paties*, or puffins, in bunches and heave them down. Owing to the projection of the rock, as the part which I now stand on is overhanging the sea, I do not not see them fall, but they do fall into the sea, and the other craigsmen picks them up in the punt. Having cautiously descended, we return to the hut and rest.

We now walk along the path to where the ascent begins. On all sides save one the Craig is surrounded by steep precipices, which are almost impossible to climb. Climbing up the steep path single file, we reach the ruined castle, which is a square tower having several apartments, and a winding stair leading on to the roof.

It requires cautious walking, as the stones are loose, and the path is a mere wild goat's track, leading close above the edge of the precipice. Where a hollow runs down to the Barrhead, or edge of the precipice, is a terrace of rock, which it is easy to climb; so taking off my boots, and strapping my vasculum (botanical box) tight on my back, I go cautiously. The ledges are white with kittiwake gulls, and their nests are scattered all about the ledges. The beautiful birds are sitting on their nest as I approach, and allow me to come almost within arm's reach without flying away, and then the poor kitties rise in a body and hover round me, brushing past my face, and uttering their peculiar cry, "Kittiwake! kittiwake!" Great quantities of nests are within reach. The nest is generally built on a little ledge, or where a tuft of moss grows, and often they hang to the side of the rock, like swallows' nests under the eaves of a cottage. The eggs, which are generally three in number, are of various colours, but generally the shade is light brown, or stone colour with dark markings of brown.

The rock birds and gulls are swarming in immense numbers on the rocks as we approach, and they seem not in the least frightened as I climb up among the rocks, being seldom disturbed here.

Being satisfied for the present with climbing, I descend to have an inspection from the water. Having rowed round the base of the precipice I have

an opportunity of observing the clouds of sea fowl on their ledges. Looking up, one seems overpowered at the immense height, and rendered giddy by the whirr of wings. On the lower rocks the kittiwake gulls breed; the

HEAD OF GUILLEMOT.

the guillemots resort to the ledges; and above them the razor-bills. The climber points out to me the only nesting-place of the "scarts," as he calls them, or cormorants. I see their ledge, and see with my telescope several sitting on their nests, a long way

out of reach. Several pairs of ravens (*Corvus Corax*), too, build annually here; also a rare bird, the peregrine falcon (*Falco Peregrinus*), annually makes his eyrie on an inaccessible craig near the top.

PEREGRINE FALCON.

The boat has been carefully pulled alongside one of the reefs of rocks; the steering is very difficult, owing to the intricate passages and sunken rocks. We carefully approach the "scart" rock, a flat rock from which the cormorants dive, and which they generally fish from. Owing to the sunken rock it is difficult to approach, but as Hudon knows every inch of the place, he pulls cannily alongside. He and I jump out, and Sandy throws out several iron traps like rat-traps. These we set on the rock, to try and catch a "scart," if possible, for stuffing.

Immense blocks of rock have fallen together, and made a rude cavern of some extent, and this the craigs-men call the "kirk," but why I cannot say. Hudon shows me another way of catching the fowl: he hides behind a ledge of rock at the entrance to the kirk, and I crouch behind; he then grasps his long bird-pole in his hand, and as an unlucky "patey" or "strannie" comes flying within reach, he knocks it down with the pole.

Hudon now collects and ties the birds together, and I stroll or clamber about, and go to the foot of the precipice and sit down and watch the incessant whirr of wings, and listen to the varied and clamorous cries of the fowl.

Presently the current carries the punt past the bend, and gently wafts us under the base of "Ashy Doo," and past the "scart rock," from which a dark green cormorant shoots off. We now get to the far side of the Craig, where huge precipices all along uprear themselves from the water. In some places the air is almost darkened with the flights of the birds, and the ear pained with the noise of their clamorous and discordant cries. Hudon gives a whoop, which echoes from craig to craig, and immediately the whole legion of birds leave their ledges: the puffins, razor-bills, and guillemots, with a rapid movement of their wings, plunge with the speed of thought into the sea, and the gulls, with cries, circle round our heads as thick as snow-flakes on the blast of the north wind. Whole schools of puffins and other rock birds are sporting in the sea, some with feeble cries of delight dashing the water over one another, others diving after sprats, and pursuing their prey with wings as well as feet. The kittiwake gulls do not seem to

dive so much, but lie motionless on the calm water, or poise themselves on one leg on the rocks, or sail with slow extended wings through the air.

Drifting round a projecting rock, a huge cavern opens far into the bowels of the earth, and as we approach several rock doves, wild slate-coloured pigeons, fly out. Drifting round another line of rocks, we see myriads of solan geese clustering on the ledges, and flying far up overhead; huge white or light grey birds, with their long slender wings just tipped with black.

In rowing back the fierce heat from the cloudless sun, as it shines down untempered by a breath of air, is almost suffocating; so during the middle of the day I rest on the rocks in the shade. Then, as the afternoon draws to a close, Sandy says that if I like to go up to the Barrhead he will show me the place where the "gants" breed. I accordingly take a stout staff in my hand, and, after following Sandy some distance round to the far side of the Craig, he tells me to shut my eyes, and carefully leads me to the verge of the precipice, and when I open them at his signal, the quantity of gannets is something amazing.

GANNET, OR SOLAN GOOSE.

I have never seen the breeding-place of the gannets before, and the sight and the noise almost make my brain reel. I cautiously sit down on the top of one of the pillars, and gaze long and in silence. A hollow-shaped bay or amphitheatre of rocks rises sheer from the sea about six hundred feet high or more, I should think, formed of regular columns or basaltic pillars, and on the top of each of these pillars, of which there are myriads, broken off all the way up, is the nest of a gannet, on every ledge as close as they can stick, and the noise which the thousands of gannets make passes description. Close under where I sit are several nests, and I cautiously climb down with Sandy to inspect them. A great bulky nest it is, large enough to fill a coal-scuttle with, composed of sea-weed, dried grass, moss, etc., and in each nest there is *one* egg. Hence, some say, the origin of the name solan goose.

But now the fierce heat is declining, as the sun is sinking in the west, and faint zephyrs gently fan my heated face. Sandy goes along the Barrheads farther, while I climb gently up the sides of the Craig; but toiling over the rocks and clambering up the precipices is hot work, and I leisurely proceed. First a sloping terrace, followed by a ridge of bare rock, then another terrace, then a low marshy sort of swamp, with

a lagoon, or wee loch, the waters of which are black with peat, but with which I slake my burning thirst. A few more trifling steps, and what a gorgeous spectacle is unfolded at my feet.

In the dim distance, faint in the gathering mist, Malin Head rises from the broad Atlantic, and then the huge bulk of Rathlin Island, and the dread Giant's Causeway, are seen darkly frowning over the waste of waters, and the very fields and villages are seen on fair Erin. The wild Mull of Cantire, and Sanda Island, with its white lighthouse, are distinctly seen under the setting sun; and one's eye ranges lovingly over the picturesque Cantire side, past Campbelton Harbour, till the land slowly sinks into Tarbert Loch. Green Islay is peeping over, with the terrible Mull of Oe, and the three Paps of Jura looking like faint and delicate cloudlets. Beauteous Arran lies at my feet, with wee Pladda sleeping at her side, with all her tumultuous and terrible crests of rock, Goath Bheima, the mountain of the winds, looking proudly around her, while Cumbray rises like a vast iceberg from the lovely Clyde and fertile Bute, past which the blue Loch Fyne wanders, till it is lost in the labyrinth of hills.

But slowly the sun is sinking in the west. Behind the mighty Paps of Jura a few faint and gauzy vapours, which before seemed ethereal as spirits, now are glowing red as fire, as they wait upon their king; the whole horizon brightens; the hills are sharp and clear and red as flames of fire; and the faint and far-off cliffs of Ardnamurchan, rosy as maiden's blush, look like evening mists, but in reality are firm as the foundation of the world. The Arran hills are tinted with gorgeous lights, one side bright and pure, the other purple and dark. The great rock throws its shadow far across the water—the water, which is, as it were, a sea of flame, brilliant yellow, gradually fading into a bright red, as flames playing over glowing charcoal, save where rugged islets rise,

"And break the spreading of the golden tide,
And fling their shadows on the pictured deep."

Here long I linger, unable to tear myself away from the lovely scene; and the last quivering ray of the sun has sunk, and slowly the rosy light pales into fainter yellow, and fainter is the glow reflected in the calm water, and the last tints have faded from the hills; though the crests are yet warm and ruddy, their corries and valleys are black as a storm at night. Ireland is slowly fading from my view, and one by one the westernmost islands pale and fade away. The daylight still lingers about the few snow-clad hills of the far north, and the horizon is still bright and lambent. But in the east, one by one the stars appear faintly flickering, like angel spirits keeping watch over the world by night, and slowly the pale crescent moon rises from the dark hills and sheds its subdued light across the calm, still water. And the cries of the sea fowl are hushed, save when a patie more wakeful than its brethren shoots past, like an evil thought across the mind.

Now one by one the lighthouses send their steady lights across the darkening water. The Cloch, Little Cumbray, Pladda, Campbelton, Sanda, and Loch Ryan, one by one shine forth bright and steady. Slowly I tear myself from the summit, and with careful and cautious steps descend in the increasing darkness.

Hudon is about to start to look for me, as he wonders why I am so late; and when I tell him I have just come from the summit, he wonders how I have found my way in the gloom.

I awake next morning at grey dawn, and hastily

dressing, sally out. It is about half-past three, and the sun has just risen over the Ayrshire hills. Already the sea fowl are astir, and are sporting and playfully dabbling in the water; a faint yet fresh breeze is blowing, the breath of the morning gently rippling the blue sea. I ask Sandy to accompany me, as he promised, up the Craig to get some choice varieties of eggs for cabinet specimens; so while Hudon is lighting the fire, he takes me up the hill, past the castle, and wading through the wet brackens, we climb the first terrace. Deliciously cool and pleasant the air is, and on every side the glad notes of the birds resound. The rock pipit (*Anthus Aquaticus*) is uttering its shrill call, and on each craig of rock sits a sedate little puffin; the curlew (*Numenius Aquaticus*) is wheeling above us, and the thrush, or mavis, strange to say, is singing blithely, and very sweet its touching strains sound, echoing among the rocks. The ring ouzel (*Merula Torquata*) is here as usual, flitting about the rocks, and scolding us for intruding near its nest. But I have no time to stay and search for it, as I want to see the gulls.

We are now approaching the place where the big gulls breed, and I see them at a distance, sitting among the ferns and on the top of the jutting rocks. First one and then another rises, and then all rise and wheel in the air, high up, on motionless wings, slowly gliding and floating as lightly as spirits. As we approach nearer, they get more clamorous, and bark like dogs. I find a nest of the lesser black-back gull (*Larus Fuscus*), and immediately after another, both with three big eggs in. Suddenly I come upon a nest with three pretty little young gulls in it, just like chickens, only with webbed feet, and curiously spotted all over like the spots on the eggs. I take one in my hand, and the two others run and hide among the rock and fern, but while I am examining my captive, the enraged old ones swoop down on me in an alarming manner. They soar to a great height, then with outstretched wings swoop down upon me, a few feet above my head, and soar the other side; then swoop down again, coming each time closer, as if to strike me, and the rustle and vibration of their feathers makes a noise as if meant to intimidate me.

But Sandy is calling; so leaving the big gulls to their airy flights, I follow after him as he leads straight to the bay of the gannets. He takes off his shoes, and I do the same, and cautiously walk over the edge of the precipice along a narrow shelf on which the gannets are breeding. The myriads of gannets are still sitting on their nests, and the males are away fishing, and now and then one comes floating from seaward towards the Craig, and I see him disgorge his fish for the sitting partner to breakfast on.

I take one or two of the cleanest eggs, as they are the freshest, and then Sandy and I come back to the glen that runs down to the Barrhead; and climbing about the sharp and rugged precipice, Sandy selects some fine varieties of the razor-bill, beautifully clouded and mottled, also a few uncommon varieties of the guillemot, and what is a prize, I see a bridled guillemot (*Uria Lacrymans*) sitting on a ledge. With some difficulty I climb to it, and find that its egg is fresh laid, which I take.

Packing the eggs carefully in my vasculum, I climb back to the top, and follow Sandy down the now more familiar path. During my absence up the hill, my boatman Rab and his laddie have arrived from Girvan, having had to row almost all the way, there being little or no wind.

After breakfast, as a puff of wind is rising which we mean to take advantage of, I pack up my treasures of eggs and specimens, my traps are placed in the punt,

and we row out to the boat, which is anchored off the Craig. Then the craigsmen give me a parting cheer as the lug is hoisted, and we slowly drift out, and I give them a parting wave of the bonnet as I leave the Craig with great regret.

T. C. W.

THE RIGHT WAY OF POKING THE FIRE.

We have often remarked that, however modest and humble people may be in their pretensions in various arts and accomplishments, and however willing they may be to yield the palm of excellence to others, there is yet one accomplishment in which everybody invariably imagines that he excels everybody else—and that is the art of poking the fire. It is true you may not hear people express this secret conviction, but if your observation is worth a straw you may read it in their faces whenever one person in a company ventures to poke the fire in presence of the rest; and if your candour is on a par with your observation you will confess that you rarely—we might almost say never—see a fire poked without feeling, however deftly it has been done, that it still wants just one finishing touch at your own hands.

Various, indeed, are the methods of using the homely instrument whose special function it is to rouse the sleeping embers in the grate, and cause the cheerful flame to enliven the domestic hearth with genial light and warmth. Professors of chirography tell us they can evolve the mental portraiture of man or woman from an inspection of their handwriting; for our part, we feel confident that revelations much nearer the truth might be derived from a careful consideration of the way in which a person handles the poker. Let us look at a few of the methods most in vogue. First, there is the bold, careless, slapdash method, in which the performer thrusts the instrument between the bars without a moment's consideration of what he is about—rakes the coals this way and that for a quarter of a minute or so, and then throws down the instrument with a bang and a clang that startles pussy from the hearth-rug and sends her scampering. Still less tolerable is the persistent method in which over-earnest minds are apt to indulge, when the performer, having got possession of the poker, is loth to relinquish it, and goes on digging and picking at the fuel until his wife gets up from her chair and takes the instrument out of his hand; or, the lady being absent or failing to do that, the fire is finally poked out, and the bell is

rung for Betty to come and renew it. Allied to these two methods is a third, still more demonstrative, which may be called the savage method, in which the performer storms the fireplace as he would an enemy's fortress, deals furious blows with his weapon upon the casemated upper works of caked lumps, and supplements these assaults by fierce lunges into the very vitals of the fire, as if resolved to tear its heart out. Such are the "heroic" methods of poking, in which those who adopt them may pride themselves if they like; but we confess to a preference for more moderate measures, as exhibited in a contrary style of practice. Among the moderate methods we may mention the encouraging mode, in which the poker, as it were, pats the blinking fire on the back, just to cheer it up a little, then gently clears away the lower strata of ashes, lets a little more oxygen into the lungs of the fainting subject, and so entices it to make an effort to recover itself and show the domestic circle a cheerful face. Analogous to this is the sympathetic and cautious method, which has to be pursued when the fire is at its last gasp and would certainly perish irrecoverably were it roughly handled. In this case the operator has to use the utmost dexterity, and to exercise at once prompt action and enduring patience: he cherishes the spark by supplying fresh fuel; he makes a passage for the current of air to the exact spot where it is wanted, and with the point of his instrument he adjusts those particles of fuel which, being in a half-burnt state, are the readiest to catch, so that they shall receive, retain, and spread the combustion.

Other methods of poking the fire might be here described were it worth while; but we pass them for the present, being desirous of turning our attention briefly to another aspect of the subject, which we may be allowed to designate its moral aspect.

There is no risk in asserting that society in all ages has stood in special need of poking up, and that, morally speaking, the demand for the right use of the poker is not a whit less urgent at the present day than it was in days that are past. Men have always had to be urged, or poked up, to the performance of their duties, and in all likelihood will continue to need constant provocation to this end. The fires of love and benevolence, of philanthropy and kindness, which should be ever burning brightly in their breasts, are always getting into a low and smouldering state, and sometimes, alas! they get extinguished altogether for lack of the stoking and poking which should have been administered to them, or, worse still, because the poking has been done by rash and unskilful hands.

Now the use of the moral poker is a much more difficult matter than the wielding of the domestic instrument spoken of above. What renders it so immensely more difficult, and so often defeats the most energetic endeavours, is the fact that when using the moral poker we never know whether we are stirring a glowing fire or a mere empty grate. A man, or any number of men, may look as benevolent as Mr. Peabody or Captain Coram, and yet have no more of the fire of benevolence in the heart than there is in a lump of ice. Thus the wielders of the moral poker—the men or the women whose office it is to stir up others to good works—are always, to some extent at least, working in the dark. Such workers, however, have the consolation of feeling that they are doing the right thing; and some of them, it is pleasant to know, show remarkable skill and dexterity in doing it. The very worst methods of setting about this business are the heroic methods

foreshadowed above. Men are to be bounced and bullied and dragooned into a good many things, when circumstances are favourable to such modes of persuasion, but they are not to be compelled by any such means into a charitable frame of mind. "The quality of mercy is not strained," as the great poet tells us, and it will not stand the strain of angry, reproachful, or even of exacting pressure: if it is not allowed to drop "as the gentle rain from heaven," it is not to be had at all. If some of our habitual provokers to good works had a due appreciation of this psychological fact, we should not see the disheartening sights we sometimes see, or hear so many of the dreary complaints we sometimes hear. People go about their business in the wrong way, and then moan out their complaints because they have failed of the success they might have had by working in the right way. Conceive, if you can, a more doleful spectacle than a man in possession of pulpit or platform, and bent on squeezing charitable dole out of his audience by mere pressure of paragraphs. Like the "persistent fire poker" aforesaid, he never knows when to stop, and talks and talks, and piles up palaver on palaver, and the consequence is that he pokes out the fire of benevolence; that his audience, whom a few well-chosen words might have charmed into prompt philanthropic action, are first dinned to weariness, then to irritation, and then to resentfulness, and they button up their pockets with the feeling in their minds, that having undergone an uncalled-for scolding, they are not bound to pay for the infliction, and so they depart without giving. Dean Swift understood human nature too well to make a blunder of that kind. It is on record that having engaged to preach a charity sermon on behalf of the poor of a certain place, he took for his text the words of Solomon, "He that hath pity upon the poor, lendeth unto the Lord;" then, looking round on his congregation, he merely said, "My friends, you see what are the conditions of this transaction; therefore, if you like the security, down with your money." It was an irreverent speech, too sadly in keeping with his character, but the contributions which poured in in answer to that brief appeal were liberal beyond all previous experience in the place; and one may well believe it.

Another dean, no less witty and considerably more wise, reminds us that one result of attempts to stir up the fire of benevolence is generally to arouse a burning indignation in the breast of A because B will not put his hand in his pocket to relieve the necessities of C. This comical dictum of Sydney Smith's is tragically, frightfully true. That is the effect of the majority of appeals made to selfish humanity on behalf of their suffering fellows; so much easier is it to awaken sympathy than self-sacrifice, and so prone are all of us to slink from the obligations we should accept, and to shift them to the shoulders of others. Still it may be fairly questioned when such transferable sympathy is all that is excited, whether the exciting agent has been active in quite the right way. We are not quite sure, but we have a notion that there are ways, if we could but find them out, of enlisting not only the sympathy, but the personal assistance of most of our fellows. Perhaps the gentler methods of touching up the fire might succeed; at any rate, this seems the plan adopted by practical persons who manage benevolent institutions; they seem to go to work in a rather unsentimental way, and for the most part rely more on the influence of creature comforts than on the suggestions of duty or conscience. Thus when they want a lot of people to give generously, they get them round the

festal board and feed them first into a generous mood. We all know the results of this time-honoured method of proceeding: perhaps we are not all convinced that solid as such results frequently are, we have any great reason to be proud of them.

SAN MICHELE,

THE CAMPO SANTO OF VENICE.

THE island of St. Michele, in which is the cemetery of Venice, seems to be but little known to strangers, from the oft-repeated question, "Where do the Venetians bury their dead?" For it is pretty generally known that the nobles only, or with very rare exceptions, had their burial-places in the noted churches; whilst for the middle and lower classes, deep excavations were made in the churches of lesser note, which were called the "Tombi." To these "Tombi" the people conveyed their dead generally, each tomb being large enough to hold a hundred and more coffins, which were closely packed one on the other.

But by degrees, as the vaults in the churches became full, a talk arose as to the propriety of selecting ground for the burial of the Venetians; and as the company of the Camaldolesi monks had just at that time (1811) been suppressed, the senate took into consideration the turning of the beautiful gardens of the monastery in the island of St. Michele into the desired cemetery. The place meeting with the entire approbation of the government, the necessary works were begun, and soon the gardens which had served as a work of recreation for the monks, and were exceedingly beautiful, were demolished, and the earth levelled for the reception of the dead.

The island of St. Michele is situated at the end of the Laguna, and on it stands the church of the same name, which was built by Moro Lombardo, or Moretto, in the middle of the fifteenth century. It has an inscription to the memory of the Greek monk Eusebius, which is supposed to have been composed by Aldus Manutius.

The Camaldolesi, who occupied the monastery and church of St. Michele, were some of the most learned monks of the period, and bore great reputation for sanctity. After having held unlimited sway over the island for a period of three hundred years, the Camaldolesi were replaced by a colony of the Franciscans, whose business was to be "watchers of the dead," to see that no desecration was committed, and to wait on the funerals which arrived at the water gate of the island. This water gate is a high arched entrance from the Laguna, whence steps are cut in the sod to the second gate of the cemetery. The church of St. Michele stands nearly in the middle of the island, and is replete with interest for the antiquary in its interior decorations, and in its exterior to the lover of the picturesque. The portico of the church is supported by slight and elegant columns of white marble, and the monks have added to its beauty by causing the brightest coloured creeping plants to intermingle with roses and other sweet-smelling flowers, giving a charming grace to the old grey church. The nave is another object worthy of notice, from the delicately cut cornice of flowers which runs around it.

The Franciscans, not to be behind their predecessors, have spent a vast deal of time in making the Campo Santo as beautiful as may be for so mournful a spot, for they have made the entrance to the church look more like the entrance of a conservatory than of a temple.

Round the portico are arranged large ornamental vases filled with some of Italy's choicest treasures in flowers. The entire entrance is screened by a fine oleander, whose rose-coloured flowers receive new beauty from contrast with the glistening whiteness of the marble pillars of the portico. These flowers form a sort of frieze-work right round the church, and the monks add to their store by selling slips of them to those who wish to purchase for planting on the grave of a friend. Indeed, so harmoniously are flowers and shrubs planted, that on entering the cemetery it is hard to suppose it a place for the dead, but rather for the living, until we look around and see the mounds of earth, the crosses, and other gentle remembrances placed by loving hands above the spot where repose the loved and lost. A favourite symbol is a statue with finger pointing upwards, telling that the hope of life and immortality beyond the grave was his who sleeps beneath.

The many beautiful pieces of sculpture which adorn the church of St. Michele are well worthy of remark. The tomb of Cardinal Dolfini, Bishop of Vicenza, is one of the most remarkable, chiefly for the two figures of Faith and Prudence, which stand on either side of it. This beautiful work of the chisel was executed by Bernini. On the left side of the nave is the world-renowned group of Moses lifting up the serpent in the wilderness; and next to it the worship of the golden calf. The grand statue of the patron saint of the island, St. Michele, was the work of Gregorio Lazzarini.

There is no doubt that Venice, and those islands which spot her lagunes, possess some of the most rare gems of art to be found in Italy. This is easily accounted for when we call to mind that the price which many of the vessels paid for being allowed to anchor in her waters, was the bringing as offerings for the embellishment of the churches anything that was rare in sculpture or painting—including, indeed, everything which could add a beauty or a grace to the city.

The precious marbles, for which the public edifices in Venice are so celebrated, are not forgotten in the church of St. Michele. Over the door of the lesser chapel is a large cross of most beautiful design, in many coloured marbles. So rich is this cross in "rare colours," that it is generally designated "the cross of the precious marbles." Near to this cross is the decorated sepulchral slab which covered the grave of Fra Paolo Sarpi, formerly in the church of the Serviti, in Venice; but when that church was desecrated it was removed to St. Michele, in 1796. The friars, as usual, jealous of the superior sanctity of any who did not belong to their own order, effaced the inscription; but they were afterwards compelled, much against their will, to restore it, by special command.

The Capella Emiliana is so gracefully beautiful in its structure, that various imitations have been made of this or that part of it in many of the churches which were built afterwards in different parts of Italy, but none of them can compare with this architectural masterpiece of Bergamasco, who has the credit of its erection, in 1530.

When St. Michele was in the hands of the Camaldolesi, they had one among their number who, although he had been with them for a long period of years, kept himself aloof from his brethren, seeming as though he were always in a kind of dreamy trance, talking and muttering to himself as he strolled among the then charming gardens of the convent. None dared to question him, for some there were in that superstitious age who deemed him one who had business with the powers of darkness, whilst others, the most

charitable, considered him mad. Whatever their thoughts, it was at last quite plain to be seen that something of more than common import filled his thoughts. This was no other than the celebrated geographer, Frate Mauro, who delighted the schools of the continent by his "Mappe Monde," which work had filled his thoughts, for his whole time was taken up in making lines, and writing on small pieces of paper, of which his pockets seemed always full; but when the effect of all this writing and thinking was shown in the beautiful and correct map of the world which he put forth, all the ill-natured remarks of his brother monks were hushed, and no praise was found sufficient to express their appreciation of his merits. The map was executed for Alphonso v, King of Portugal, and embraced all that was known in the year of its construction. At the suppression of the convent this map was removed to the library of St. Mark. It has recently been published in facsimile by Viscount Santarem, the historian of early Portuguese geographical discoveries.

The funerals which take place at St. Michele have something mournfully picturesque in their appearance. On the day fixed for the interment the procession generally issues from the late dwelling of the deceased, about seven o'clock in summer, and five in winter. This is sometimes varied by its taking place before eight in the morning. The procession consists of a company of monks, who walk first, followed sometimes by a few friends of the deceased; next comes the coffin, borne, if of a female, and young, by six young women, all in white; if of a young man, by six young men. Then come the hired mourners, who are twelve women dressed in green, with black veils. These assist in the chanting of the monks. Priests and mourners all carry long wax tapers.

When the procession arrives at the church where the funeral service is to be performed, and where the subsequent masses for the repose of the soul of the dead are to be said, all enter, and according to the means of the family so is the grandeur of the service.

When all is over, the procession retires in the same order, singing, or rather groaning, the "Requiescat in pace," and the coffin is left before the high altar all night. In the early morning of the next day the closed gondolas receive the coffin at the nearest point to the church where it has been left all night, and they then take their mournful way to the island of the Campo Santo, where the monks receive the body in solemn silence.

Not only in Venice, but throughout all Italy, the dead remain in the church all the night of the funeral, under the charge of one of the inferior clergy, and are conveyed to the cemetery the morning afterwards.

The priests will not receive the remains at the gate of the cemetery, unless the service of a special mass has been said in a church. The presentation of an official certificate of death is a proper regulation, but for very different reasons than merely satisfying the demands of the clergy. The requirement of mass sometimes leads to cases of hardship, as in the following instance, which was witnessed by the writer of this paper. Some very poor people had the misfortune to lose the stay and support of their family, and not having the means of paying for the funeral mass to be said in a church, they made up their mind to carry the coffin themselves to the Campo Santo, which was some distance from Turin. When arrived there, the requisite certificate was of course wanting. The poor bereaved wife, her children, and friend who had helped in the woeful journey, had to return with their burden, resting every now and then

on the way, where they were seen, and where with many bitter tears the tale was recounted, when a subscription was made for the required service. The Campo Santo of St. Michele is visited twice every year by a sort of committee, who see that the proper regulations are carried out, and that the ground is kept in order.

The monks, notwithstanding their mournful employment, seem a happy set of men, and are great gardeners. Some of the rarest flowers in Italy are to be had in this solemn garden, and to see their dark-robed cowed figures sitting at evening among the flowers which surround the old grey church is a sight which would charm into action the pencil of the artist.

Among these quiet brothers, even in later days, there have been those whose names are well known. It was at St. Michele that Cardinal Turla, the historian of the Venetian navigators, found time to write his very valuable work; and here the late Pope Gregory XVI, under the name of Fra Mauro Cappellari, compiled his code of criminal law.

The churches and Tombs having been for some years shut up, rich and poor bury their dead at St. Michele, and as this is becoming full of the "mounds of mortality," the Venetians must ere long find another Campo Santo.

According to the population of Venice, the mortality is less than in most other cities of the continent. From a census taken in 1862, the population was 114,000, the deaths averaging fourteen per day, or about ninety-eight in a week, and 5,096 in a year. Of these deaths the causes were various, but not so much so as in other cities. Gastric fever is the most fatal to life. Other fevers prevail during the summer months, but not contagious or fatal ones. A remarkable fact is, that consumption is scarcely known in Venice, and in visiting other lands the first care of a Venetian is to guard against it. The deaths by drowning are not so numerous as might be supposed in a water city, fifty per year being the average; but the gondolas are so constructed that it is almost impossible for them to upset. The mortality of infants is less than in most parts of Italy. The longevity of the Venetians is remarkable, about twenty of the deaths being at the age of ninety, and some live even to a hundred years, worthy successors of Cornaro. On the whole, the bills of mortality will surprise those who imagine that this city must be an unhealthy one. The waters of the lagoon render the air pure, and effectually carry away all impurities.

THE LATE RICHARD HARRIS, M.P. FOR LEICESTER.

As the traveller enters Leicester from the north, he crosses a strip of land enclosed by the River Soar and the Union Canal, called "Frog Island," which contains a place appropriately designated the "World's End." A little to the west lie the "Dane Hills," which consist of several fields bearing Danish fortifications, while to the east rise the remains of Leicester Abbey, best known now as the place where Cardinal Wolsey, fallen from his high estate, retired to "leave his bones." On the banks of this River Soar (anciently Leir), the tradition of Geoffrey of Monmouth, and the genius of Shakespeare, give local habitation to King Lear with his three daughters, there residing in rural simplicity,

"In shadowy forests and with champains rich'd,
With plenteous rivers and wide-skirted meads."

On this "Frog Island" there was born, in a humble cottage, in October, 1777, Richard Harris, one of those

men of the people who, by the force of great natural abilities, combined with unswerving integrity of character, raise themselves to high social position and leave their mark in the place in which they live. He was the eldest of a family of six children. His parents were respectable and industrious, but poor, and unable to procure for him the advantages of even a common English education. It happened at the very time that the Sunday-school system, which has conferred such signal benefits on the working classes, was introduced into Leicester by the Rev. Thomas Robinson, the vicar of St. Mary's, known not only for his benevolent and active spirit, but as the author of an excellent work entitled "Scripture Characters." Amongst the first scholars enrolled was Richard Harris. Thirsting for knowledge, he also sought and obtained admission into a night school, and there and in the Sunday-school he acquired the rudiments of a plain education.

At the age of fourteen, he was placed in the printing-office of Mr. Phillips (afterwards Sir Richard Phillips), who was a prominent politician of the time, as well as an author of some repute, and the editor of the "Leicester Herald." The "Herald" sympathised with the principles of the French Revolution which was then commencing. Soon after entering the office, he became the innocent occasion of a piece of mischief. One evening, just as the paper was going to press, a frolic occurred in which young Harris stumbled or was pushed against the frame in which the type was set, displacing and throwing into confusion two or three columns of it. All was dismay! What was to be done? There was no time to reset the type. The Nottingham coach was nearly due, which required a considerable number of copies. The master was called, and his ingenious mind at once hit upon the following expedient. The broken type he still further disarranged, and converted into a hopeless mess, technically called "pie." The whole received the title "The Dutch Mail," to which the following explanation was added: "Just as our paper was going to press the Dutch mail arrived, and as we have not time to make a translation we insert the original!" The "pie" thus served up to the numerous readers of the journal occasioned no little perplexity to the linguists, and to the village politicians of the Midland Counties. No one had ever seen such Dutch, nor any other language resembling it. It was fairly an instance of an "unknown tongue," and many were the letters received from "Constant Readers," asking for an explanation of the mysterious columns, which the editor, for "want of time" and other reasons, excused himself from giving.

An informer having purchased in the printing-office of Mr. Phillips a copy of "Paine's Rights of Man," the printer, for the offence of selling it, was thrown into prison for eighteen months. The master being removed, the youth passed out of his employ, and began stocking-weaving, an occupation which was then far more remunerative than it is now. In this art he speedily excelled. Having learned all he could of the stocking trade in his native town, he travelled to Nottingham, in order to make himself master of the machinery there in use. While residing there another change in his eventful life took place. England was at the time deluged with the works of the French infidel writers written in a style adapted to captivate the mind and heart of young men. Many of these he read with avidity, and his faith in the truth and verities of the Christian religion was unsettled. At the same time the great continental war was raging, and all the resources of England in men and money were called forth against "Bonaparte." Mr.

Harris, like most young men at the time, imbibed the military spirit, and was led to join what was called the "supplemental militia." This force was stationed at different places along the south coast, to be ready in case of need to aid in repelling the threatened invasion.

After having been with his regiment in the south of England, Mr. Harris obtained a furlough of some weeks and returned to his native town. During this visit the foundation of his religious life was laid. The place of worship which his pious mother attended was that in which, afterwards, the great and gifted Robert Hall officiated. A funeral sermon was announced for the evening, and the anxious mother persuaded the sceptical son to go and hear it. He consented, and took his seat with her in the chapel. The preacher selected for his text, "A great man has fallen this day in Israel!" The announcement excited the half-suppressed laughter of the young man; for this "great man" that had fallen was a poor scissors-grinder, who by his cheerfulness and uprightness in the midst of deep poverty had won the respect of all who knew him. Quieted by the gentle rebuke of his mother, who sat by his side, he listened attentively to the preacher, who proceeded to explain the nature of true greatness, and to show how religion made men truly great, both in this world and in the next, however insignificant they might seem, when judged by the world's conventional standard of greatness. While thus listening, his levity gave way to serious reflection. He had known the poor scissors-grinder, and esteemed him for his goodness and his invariable cheerfulness under all circumstances. There must be a power and reality in religion to raise such a man in character and in happiness above all the trials of his lot; at least there *might* be, and he resolved at once to reconsider the question of the truth of Christianity. He did so, and after much reading and prayerful investigation, he renounced for ever his infidelity, and as a man would destroy the phial which contained the poison he had taken in mistake, so he burnt the books which had for a time led him astray. He became an earnest Christian, and united himself with the congregation over which Robert Hall presided, and enjoyed the ministry and the intimate friendship of that distinguished preacher until his removal from Leicester to Bristol in the year 1826.

Not long after this, apparently at the time of the peace of Amiens, Mr. Harris quitted the ranks of the militia, and retiring to his native town commenced that business career in which he eventually became so successful. When he commenced his career, the stocking-frame machine, after being long neglected and then violently opposed, had become a recognised and lawful engine of labour, but was in a rude and simple state, and his ingenious mind soon perceived that it was capable of great improvement, and of being adapted not only to the manufacture of every kind of hosiery, but of an endless variety of other articles of apparel. To the development of its capabilities he devoted his life and energies. His mind was fertile in new design, and ingenious in the alteration and adaptation of machinery to their production. His business at first was small, but year by year it increased and extended, until at the time of his death, as the result of years of skill and untiring industry, it had reached colossal proportions.

"Seest thou a man diligent in his business? he shall stand before kings, he shall not stand before mean men." Success in life, earned by honourable industry, integrity, and skill, soon brings along with it office and honours. Richard Harris acquired the confidence and esteem of his fellow-citizens, and was called upon to fill

the various municipal offices. While holding that of chief magistrate, in the year 1843, he was honoured with an invitation to Belvoir Castle, where the Queen was then staying, and a distinguished party of guests. Among these was the "Iron Duke," who seemed to court the company of Mr. Harris. Both were early risers, and long before the other guests had awoke from their slumbers they might have been seen walking in the beautiful grounds of the castle, and conversing earnestly together.

There remained yet another honour to be conferred on him, the highest in the power of his native town to bestow. During a period of nearly forty years he had taken an active though not a noisy part in the politics of the times. The passing of the Registration Act, which has proved so useful to society at large, offending no man's conscience, and leaving no man's property insecure, was in a great measure due to the external pressure which he created, and the information which he supplied to Lord Nugent and other advocates of the measure in Parliament. In the year 1848 the representation of the town of Leicester became vacant, and the electors at once turned their thoughts to Mr. Harris and his friend Mr. John Ellis. They consented to become candidates, and were elected without opposition.

An election in Leicester in the year 1826 cost one candidate £60,000. The whole cost of the election of Mr. Harris and his friend, including everything, did not exceed £200.

For four years Mr. Harris discharged the duties of his responsible position in a manner satisfactory to his constituents. He retired from public life in the year 1853, and for a time enjoyed the "*otium cum dignitate*," moving quietly about in his native town, unostentatiously and in various ways doing good, respected and honoured by all who knew him. "When the eye saw him it blessed him." He passed into rest February 2nd, 1854, amidst every demonstration of respect by his fellow-citizens.

ROYAL ALBERT HALL OF ARTS AND SCIENCES.

AFTER the close of the Exhibition of 1851, many claims were urged on her Majesty's Commissioners for the disposable estate at Kensington Gore. The South Kensington Museum came in for the larger share, but a successful application was also made for ground upon which to build a great central institution for promotion of scientific and artistic knowledge as applicable to productive industry. Under this plea a site was granted, on a nominal rental of a shilling a year, for 999 years, which is estimated as a donation of £60,000. The site is on the south side of the high road to Kensington, opposite the Albert Monument. The foundation-stone was laid by her Majesty, and the hall has the prestige of being associated with the memory of the good deeds of the Prince Consort, as patron of art and industry.

The plan of the building, first designed by the late Capt. Fowke, R.E., was on his death carried out by Lieut.-Colonel Scott, R.E., and the construction is hastening toward completion, under the charge of Messrs. Lucas.

As the scheme advanced, a larger scope was announced in describing the possible uses of the edifice. To the advancement of industrial art were added various projects, combining commercial with scientific advantages, as in the case of the Crystal Palace. The estimated cost being about £200,000 rendered every extension of the original project advisable. "The hall," we

are told, "will be available for national and international congresses of science and art; for performances of music, both choral and instrumental, including performances on the organ similar to those now given in large provincial towns, such as Liverpool and Birmingham; for the distribution of prizes by public bodies and societies, conversaziones of scientific and artistic societies, agricultural and horticultural exhibitions, national and international exhibitions of works of art and industry, including industrial exhibitions by the working classes similar to those recently held with so much success in various parts of London; for exhibitions of pictures and sculpture, and for any other purposes of artistic and scientific interest."

Such is the formal catalogue of uses of the building, but practically it will chiefly be used during the London "season" for great musical performances, for flower shows, and for the evening dress conversaziones of the Society of Arts, and other corporate institutions. Subscribers of £1,000 may obtain a box to contain ten persons in the principal tier; £500 a box for five persons in the second tier; and so on, in proportion to site and accommodation, as in a theatre. The hall is designed to accommodate 8,000 persons at orchestral performances, besides the singers and musicians. Between 5,000 and 6,000 of the sittings will be available for revenue by occasional visitors, besides the permanent rents of subscribers to the boxes and stalls. The liability of subscribers is "limited," and their special places may be "conveyanced" to other occupants. The whole scheme is on a vast scale, but is of so miscellaneous a character, that some will almost regret the association with it of the name of Prince Albert, and the recollection of the Exhibition of 1851.

THE CORPS OF COMMISSIONAIRES.

In the "Leisure Hour" for June, 1866, we gave an account of the origin and early history of the Corps of Commissionaires. Established by a few benevolent individuals, with much labour and difficulty, the institution has gradually commended itself to public favour, and is now nearly self-supporting. From the last annual report of the executive committee we learn that there has been a steady increase in the number of members of the corps, as well as in the demand for their services. The report states that—

The motion submitted to the House of Commons by Sir Charles Russell, V.C., relative to the employment of soldiers and sailors in the public offices, the reception it received, and the general drift of the public feeling, are all tending to the more extensive employment of old soldiers and sailors in the public departments; and we feel satisfied that this institution may be expanded, if duly supported, so as to meet a largely increased demand with qualified and reliable men, discharged from the army and navy, to fulfil the duties that may be required from them.

With this end in view, we would most earnestly press for more extended pecuniary support from the public generally, and from both the army and navy, it being remembered that all the benefits of the institution are equally open to, and, indeed, are largely taken advantage of by, both services. It is hoped that both in her Majesty's ships and regiments general subscriptions will be entered into in support of the institution; a very small amount from individual officers will effect great results in benefiting the institution. A subscription of 5s. a year from each officer in a regiment will in two years entitle a corps to a perpetual governorship.

An opportunity having occurred of purchasing the barracks of the corps on advantageous terms, the commanding officer has acted with much promptness and decision in securing them. The advantage of this acquisition to the institution, in both a practical and financial point of view, cannot be doubted.

The purchase-money, however, has to be raised, and it is hoped that the efforts and contributions of all well-wishers to the corps will not be wanting to meet the emergency. We cannot believe that the public will allow the founder to suffer from having effected an arrangement of such manifest importance to its interests.*

We beg to call your attention to the inadequate stipend now provided for the Adjutant. If this officer does his duty by the corps, his post is a very arduous one. The present Adjutant is well qualified for the position, and zealous in the performance of his duties. It is very desirable that, if means can be provided, he should be rewarded more adequately and proportionately to the extent of his duty and his responsibilities.

With respect to the management of the corps, all persons subscribing £10 are life governors, and regiments whose united subscriptions among officers, past and present, amount to £25, are perpetual governors, having the right to nominate one of their body as a representative of their interests.

The veteran Sir John Burgoyne, one of the trustees of the Endowment Fund, has published in the "Times" the following appeal on behalf of what he terms "one of the most meritorious and practical measures for the benefit of the army and navy which has been set on foot in modern times."

No measure can be indifferent to the British public which tends to reward and add to the comforts of the retired soldier and sailor of her Majesty's service, and which, in addition, brings valuable qualities into the activity of social life instead of leaving them buried in idleness and penury.

There are many qualities peculiar to the soldier and sailor, and imbibed by him in the ordinary course of his service, which, added to good character and conduct, may render such men more eligible than others for various services in civil life. Among these may be reckoned the habit of implicit obedience to any order he receives, without reference to any especial inconvenience it may occasion him, or troubling himself by much consideration as to its import; and to this may be added a degree of fearless spirit in the performance of what is required of him, and in protecting whatever may be entrusted to his charge, which is inculcated by his profession.

There are many requirements in the business of life which render these qualifications of more value than the possession of particular ability, skill, or bodily power.

As a trustee of the institution, it has been my duty to examine the details of its administration, and I think every one conversant with the requirements of so large a body of men will admit the moderation of the expenses.

If the money required for the purchase of the existing barracks of the men—viz., £5,000—could be raised by subscription, the income of the corps would be augmented by £250 a year, and the expenses of the increased establishment would be brought within the annual interest of the investments, and thus stand upon a sound basis. For this comparatively small sum the public would be furnished with a never-failing supply of trustworthy men, to whom could be entrusted with confidence the care of valuable property, and upon whose exactitude and probity the most complete reliance could be placed. I have known cases where, during the prevalence of an epidemic, families have left premises which were infected in the sole care of one of these commissionaires, and there is not one who would hesitate to assume the charge under such circumstances. If old soldiers and sailors have their failings, they have also their virtues, and so long as such qualities as fidelity to a trust and contempt of danger are valuable to society, it is worth our while to make an effort to render permanent an institution which will place those qualities at our disposal in times of need.

The effective strength of the corps is at present about 380. It is estimated that there is permanent employment for at least 800 men in London alone.

* Subscriptions for the Endowment Fund are received by Messrs. Cocks and Co., Army Agents, Craig's Court, Charing Cross, S.W., and also by the Adjutant of the corps, Exchange Court, 419, Strand, W.C. Exclusive of the balance of the "Times" Crimean Fund, the interest of which is paid by the Charity Commissioners to the trustees of the institution, the total subscriptions of the public to the Endowment Fund of the corps from its foundation up to the present time are less than £1,800. This fund is intended for the payment of the Adjutant and requisite staff, the rent of the offices, and such other items as could not be fairly chargeable to the soldiers and sailors composing the corps.

Varieties.

FALSE HAIR.—Long hair now costs as much as 110*s.* a pound; short hair ranges between 18*s.* and 35*s.* One of the principal dealers in human tresses occupies a house five stories high entirely to himself, and last year he did business to the extent of 1,233,000*s.* The capillary *razzias* executed among the peasantry no longer suffice to meet the enormous demand. The hair of dead persons, cut off the corpses in the hospitals, is a great help, but still insufficient. So importations from abroad are had recourse to. Certain German provinces specially supply fair hair. Black hair is to be found in South America, whence whole cargoes of it come; while to North America we export immense quantities of hair made up into head-dresses. The dearest hair is the completely white.—*Paris Paper.*

SEA BEAR.—M. Le Compte was sent out this spring by the Zoological Society to the Falkland Islands for the purpose of collecting sea bears and penguins. He succeeded in capturing no less than eight sea bears, of which he shipped four in safety for England. He laid up a quantity of sea fish as provision for his animals; but one of the passengers being taken ill with a chest disease, it was imagined that there was yellow fever on board, and the doctor ordered Le Compte to throw all his fish over. The consequence was his sea bears gradually died; one only survived, and this poor beast had nothing to eat for nearly three weeks. Le Compte, however, managed to bring it safe to the gardens, where it now occupies the cage of its late relative. It is about the size of an ordinary seal, very thin, as may be imagined, but still in good health. Le Compte collected as many as sixty penguins, but brought none back alive, on account of the difficulty of procuring food during the sea transit. He informs me that there are vast numbers of penguins at the Falkland Islands; last year that no less than 405,600 were slain, skinned, and boiled down to make oil. They yielded 50,700 gallons of oil, worth 1*s.* 7½*d.* per gallon, making a total of £4,119 7*s.* 6*d.* Le Compte has also brought with him an Antarctic wolf, a pair of Upland geese, and one Kelp goose (new to the Gardens), and two falcons.—*Land and Water.*

NEW ZEALAND.—Scarcely thirty years ago almost the sole occupants of New Zealand were a few English missionaries, who have generally been the pioneers of civilisation in those distant countries. Some ten years later, Lord Auckland, then at the head of the navy, foresaw that the easiest and shortest mode of success in New Zealand was a complete exploration of all its shores. This was undertaken under his auspices, and completed within seven years. During this period colonisation advanced very rapidly; and at the present time, in spite of many difficulties from native wars, the islands of New Zealand are inhabited throughout their length and breadth by Englishmen and Englishwomen, in possession of all the comforts and prosperity of an old and long-settled country.—*Captain Richards, R.N.*

SUNDAY RECREATIONS.—A paragraph having appeared in the "Times," to the effect that Baron Bramwell and Mr. Justice Lush, two of her Majesty's judges, when on circuit had spent some hours in visiting the Leeds Exhibition, Mr. Justice Lush wrote as follows:—"There is not a word of truth in the statement. I never went nor even thought of going to the Exhibition on a Sunday; and as to my colleague, Baron Bramwell, he was not in Leeds on either of the two Sundays while the assizes lasted until late at night. I should be sorry to have it supposed that any act of mine had afforded a precedent for visiting or an argument for opening places of amusement on a Sunday."

EUROPEAN EMIGRANTS.—During a recent month nearly 30,000 emigrants landed at New York from Europe. About 23,000 of them landed from steamers; about 20,000 were from German and French ports, and upwards of 26,000 of them were steerage passengers. They arrived in nearly forty ships. There were thirteen births on board the ships during the Atlantic passage. The bulk of the emigrants were from Germany and the north of Europe, which contain a population of 70,000,000, and from which there is a perpetual exodus. The chief persons engaged in this enormous passenger traffic are two German steam-packet companies, called the North German Lloyd, and the Hamburg and American companies, who will before long have a fleet of forty monster screw steamers, as large and as fast as any in the world. They are now rapidly building five gigantic steamers, at a cost of upwards of £500,000. This

fleet will form a nursery for a German navy. They have now lines to New York and Baltimore, and they will soon have one to New Orleans. These companies will monopolise all the passenger traffic between the Weser, Elbe, and Solent, and the Hudson, Chesapeake Bay, and the Mississippi. What they get for carrying mails scarcely equals what they pay to the English Trinity Board. The German steerage passengers are persons possessed of a little money, who forsake Europe for the far west, where there is perfect religious and political freedom, and a boundless territory and field for enterprise. The Germans form almost the whole population of some towns and cities in the United States. They indulge in their social and religious customs in their new home, and only change their language for the English. They are most welcome emigrants.

BUNSEN IN THE HOUSE OF COMMONS.—As a German, what he admired and envied most was, after all, the House of Commons:—"I wish you could form an idea of what I felt. I saw for the first time *man*, the member of a true Germanic State, in his highest, his proper place, defending the highest interests of humanity with the wonderful power of speech-wrestling, but with the arm of the spirit, boldly grasping at or tenaciously holding fast power, in the presence of his fellow-citizens, submitting to the public conscience the judgment of his cause and of his own uprightness. I saw before me the empire of the world governed, and the rest of the world controlled and judged, by this assembly. I had the feeling that, had I been born in England, I would rather be dead than not sit among and speak among them. I thought of my own country and was thankful that I *could* thank God for being a German and being myself. But I felt, also, that we are all children on this field in comparison with the English; how much they, with their discipline of mind, body, and heart, can effect even with but moderate genius, and even with talent alone! I drank in every word from the lips of the speakers, even those I disliked."

COPYRIGHT.—Miss Cummins, a citizen of the United States, whilst staying in Canada, published, in England, her work, "Haunted Hearts," which was duly registered. The question came up for decision in a three-fold form: (1) Where, in order to obtain a copyright, must publication take place? (2) What is the area over which the protection of such copyright extends? and (3) Who is entitled to the copyright? The Lord Chancellor held that the publication must take place in the United Kingdom; that the protection extends over the whole British dominions; and that every one publishing in the United Kingdom is entitled to the protection of the Act, no matter where he may be resident. The other law lords concurred in the decision.

AUSTRALIAN GOLD COINAGE.—The quantity of sovereigns issued from the Sydney Mint averages fully 35,000 a week, or nearly 1,800,000 a year, besides from 500,000 to 1,000,000 half-sovereigns. This, to a certain extent, may account for the non-issue of sovereigns in 1867 from the Royal Mint at London. A large number of the Australian sovereigns are exported to China, India, and the islands; a few are to be met with in the ordinary circulation here. Such is the purity of the Australian gold from which these sovereigns are coined that they are considered to average two-and-a-half per cent., or from 3*d.* to 6*d.* each, more in value than Royal Mint sovereigns. A branch of the Royal Mint has also recently been established at Melbourne, which will shortly commence work, and probably to a certain extent, if not entirely, supersede that of Sydney, Melbourne being the centre round which nine-tenths of the Australian gold is produced.

THE SNUFF TOWER AT NORWICH.—This tower, of which an engraving was given on page 536, was formerly known as the Black Tower on Butler Hills. In 1623, during a time of pestilence, this tower was fitted up as a temporary hospital for the infected poor, and a keeper appointed to prevent their intercourse with the outer world. A man named Thomas Chambers was the first who filled this office, and his salary was fixed at four shillings a week. Five years afterwards the plague re-appeared with greater violence than before. An acre of land around the tower was enclosed with high boards, and six houses were built within it for pest-houses. Guards were kept at watch day and night. The tower was subsequently used as a snuff mill, whence its modern name. In July, 1833, it was struck by lightning, and the roof, which was then thatched, was completely destroyed.

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cooper.*

THE PRISONERS TAKEN TO THE CASTLE OF SALZBURG.

THE EXILES OF SALZBURG.

CHAPTER XIII.

ONE misfortune seldom comes alone. Hans, on his way home, experienced this truth when he received mournful intelligence from a man who was coming from Salzburg. He found his Barbara, blithe and cheerful, in the little stall where she was foddering their only cow. After having told one another all the trifling incidents that had occurred in their short separation, Hans inquired,—

• "Where is our mother?"

"In the garden. Why dost thou ask? Thou art looking so pale. What has happened?"

"Nothing to me, but there has to one of us."

"Thou alarmest me. What is it?"

"If thou wilt promise me not to mention it to thy mother, I will trust thee with what I heard on my way home."

"Well, I will; do but put an end to my suspense."

"I trust that my informant may have deceived me; but he asserted that there was a report at Salzburg that the persons who have been despatched on an embassy to the emperor had been stopped at Linz, and because

PRICE ONE PENNY.

they had no passports had been made prisoners as rebels."

"And my father?" said Barbara, convulsively.

"Only one of them escaped," proceeded Hans, "and the rest are already on their way here to be delivered up to the archbishop."

"May the Lord have mercy upon them!" she ejaculated.

"Now I mean," said Hans, "to set about inquiring whether thy father is amongst them, or if he has saved himself."

"I will go with thee," cried Barbara, eagerly.

"Thou!" said Hans, with surprise. "And what would then become of our boy in the mean time?"

"I shall wean him," she replied. "I have thought some time of doing so, and now I am determined, for my limbs are so trembling with fear, that the nourishment he would derive from me would be poison to him. And besides, it will be all the better for him not to see me for two or three days. My mother is fond of nursing him; and so I will go with thee."

"If thou wishest it, come," said Hans. "Only we must find an excuse for leaving thy mother, so that she may have no suspicions."

This matter was soon arranged, and directly afterwards the pair were, with beating hearts, proceeding on their journey in the valley of the Salza, in the direction of Salzburg. By this time the report respecting the imprisonment of the deputies had gained wider circulation: they soon met three women and a girl, who told them that they were likewise desirous of ascertaining the fate of their relatives.

The road from the mountains to Salzburg leads over the pass of Lueg. Here a small fortress commands and intercepts the path, which for a short distance winds over and between lofty and precipitous rocks, and is therefore justly denominated the Cell of Lueg. A handful of soldiers might easily defend the passage against a considerable body of troops, the only entrance being a covered way, provided with a strong gate. A little before their arrival at this part the travellers discovered at some distance, with great surprise, evident signs of activity displayed on the heights which encompassed the dell. Hundreds of men were employed in erecting ramparts, constructing barricades, and dragging up artillery. The grief, however, which afflicted the travellers suppressed their desire to learn the cause of these extraordinary preparations; they therefore were hastening onwards with the determination of passing the Cell—a procedure, however, in which they were stopped by a strong guard who held the outer gate.

"Stand back!" was the harsh command of the officer on duty.

Struck with astonishment, they remained transfixed to the spot.

"Whither do you go?"

"To Salzburg," they replied.

"For what reason?" Anxiety and a gloomy foreboding caused each of them to think of some other reason than the true one. The soldier looked at them irresolutely and doubtfully.

"Only two of you can be permitted to pass at a time; the others must turn back. You must therefore agree amongst yourselves who shall remain behind."

"But, my dear sir," replied Hans, modestly, "I have gone through the Cell hundreds of times, and with a much larger company than now, and the passage was never before refused to us."

"Ay, but then you were considered good subjects.

Since that time, however, it has been discovered that thousands of you are rebelling against your sovereign, and as the worst may be expected from you, due precaution must be taken."

The travellers gazed at each other in perplexity.

"Decide," urged the officer; "my orders are to allow only two men to pass at a time."

"But, please sir," said Barbara, taking courage, "we are not men. You see here only one man and five women."

"Humph!" muttered the son of Mars, perplexed at this simple objection. "That might be a question; it would not be the first time that a man had worn a woman's gown to obtain his object."

A dispute now arose amongst the travellers, who should, and who should not, be left behind, but the contention was soon terminated by the officer, who constituted himself arbiter on the occasion. As is usual among men, the other sex, and the young and beautiful amongst them, were preferred. Barbara and the maiden before mentioned were selected to pass, but the others were ordered to return. Still, however, Hans did not abandon the hope of making the officer relent.

"Pray, sir," he began again, "since thou wilt not allow more than two to pass at the same time, when may another couple pass through? In a quarter, half, or a whole hour? What interval is prescribed?"

With eyes wide open, the officer, who in all probability would never have invented gunpowder, stared at the questioner.

"There is nothing of that sort in my orders," he answered at last. "But thou art right, young man; this must be amended. The first opportunity I will send one of our men to Salzburg for instruction respecting this matter. Thou must have patience, my lad, until he returns."

In the mean time Barbara proceeded on her way, torn by conflicting feelings. She would have wished to return to her husband, and she was anxious to meet her father: thus she arrived at Salzburg, which the prisoners had not yet reached. She scarcely allowed herself time to eat a piece of bread, which was moistened partly with her tears, and partly with the water of the castle fountain, before she again hurried on her way to Linz. Night closed upon her. A barn afforded a miserable shelter, which, though footsore and weary, she again left at break of day.

It was about seven o'clock in the morning of a lovely May day, 1731, when she perceived, at a bend of the road, the glittering lines of the imperial dragoons defiling out of a green wood. Two hundred and fifty soldiers accompanied three waggons, in which were lying twenty-two of her countrymen fettered and helpless. She was not able to press through the dense crowd which encircled the prisoners, although she was bold enough to make the attempt, in the midst of clouds of dust from the horses' feet. Besides this, the sides of the vehicles were so high that she could only catch a glimpse here and there of some of the heads of the unfortunate captives. Her feet almost failing her, she implored the captain to inform her if Manlicken was among them. Deaf to her entreaties, he silently motioned her to go aside. She experienced the same treatment from the rest. In this manner she ran along through clouds of dust, heated, out of breath, her heart beating quick with anxiety. At last she perceived at a little distance, by the roadside, a walnut-tree, whose branches spread over the pathway. Thither she flew, climbed up the tree, and looked down to discover her beloved father.

The waggon passed slowly beneath. Eight fellow-sufferers were in it sitting side by side. The silvery hair, which stole from under their rounded hats, testified that it was not youthful presumption which had urged them to the step they had taken. Silent and patient, they sat there with their heads bent and their hands joined as if in prayer.

"Manlicken! father!" cried Barbara, sobbing. Her agonised cry wrought magically upon their deeply afflicted hearts. All the eight heads turned towards her to see whence the cry proceeded. But he (Manlicken) was not among them. Quickly her eyes now sought the second waggon. At the same call from Barbara, the same action was repeated. And again, among seven countenances on which grief was imaged, she perceived no trace of her poor father. The hope that Manlicken might be the one who had escaped began, notwithstanding her struggles against it, to take possession of her mind. This violent conflict of her feelings affected her frame so strongly that the branches of the tree to which she clung for support trembled. Her breast heaved, and her heart beat violently, as at length the last waggon drew near, and with it the great and important decision of her hopes and fears. She could scarcely pronounce her father's name; but there were the pale features of Manlicken gazing at her. He raised his hands to her, fettered as they were; his lips appeared to utter something, which through the rumbling of the waggons and the trampling of the horses her ear could not catch. She had almost fallen from the tree, but when she descended she lay motionless at the foot of it for some time; and yet such was the strength of her affection that she arrived at Salzburg at the same moment as the prisoners. At the imminent peril of her life, she made her way through the midst of the dragoons to the gate of the fortress of Hohen-Salzburg, to which the prisoners were conducted. But when they were descending from the waggon, Barbara could only behold her father at a distance.

"They will be lodged nine fathoms deep underground," said an old invalid to her, "where neither sun nor moon will ever shine upon them, but where, at all events, they may rebel against salamanders and slowworms." Fortunately for Barbara she did not hear these words; she only saw her father look once more towards her, and then descend into his horrible grave. She found herself at last standing near the cathedral of Salzburg. How she had come there she knew not. Nor did she perceive for some time that there was a person eagerly offering her consolation. It was only when he named her father, whom she should often see and converse with, and that for this purpose she should during her sojourn there reside in the house of a respectable woman close by—nay more, that she might even be able to restore Manlicken to liberty—that she became attentive, and recognised in her comforter the young Baron Von Motzel. As if in a dream, Barbara, scarcely conscious of what she did, suffered him to lead her through several streets to a remote part of the city, where he committed her to the care of a woman who seemed to know the baron perfectly well.

For the next two days, the young baron made several pretexts for visiting Barbara, always endeavouring to console her with the belief that she should see her father immediately after his first examination. He now appeared, even to himself, in quite a different light from what he had hitherto done. He was no longer, as formerly, the gay and reckless cavalier, but evinced in all his words and actions his admiration and respect for Barbara's beauty and modesty, and a deep-seated sym-

pathy for her sorrows. The father of Von Motzel, having by the most nefarious means acquired a large fortune, raised himself from the low rank of tax-gatherer's clerk to that of warden of Werffen; and it was his most anxious wish that his son should, by forming some high alliance, ennoble their family, and by such means bring them into that station in society which it had been his constant aim in life to secure. He accordingly fixed upon a young lady of noble birth, the wealthy heiress of the Chancellor Von Rheligen. Von Motzel entirely coincided in his father's views on the subject, and as on the first proposal of the projected alliance he saw no obstacle to the continuance of the gay and careless life he was leading, he gave himself no further trouble about it, but left the arrangements to be made by the warden.

On the evening of the third day after poor Manlicken's imprisonment, there was a brilliant assemblage of persons of the highest rank and consideration of Salzburg, at the house of the parents of his betrothed. The young baron was likewise there. He had always viewed his future bride with feelings of indifference, but now his indifference almost amounted to aversion, as the image of the pure, beautiful, and noble-minded Barbara presented itself to his mind. He was naturally of a good disposition, but he had been thrown early into the society of young men of rank and fortune, whose acquaintance it had been the sedulous desire of his father he should cultivate. He had insensibly adopted their manners, and was thoughtlessly drawn into their pursuits, and had thus obtained the character of a profligate. The beauty of Barbara, rendered still more touching by the grief caused by her father's imprisonment at Castle Werffen, had first attracted his attention; and as he observed her ceaseless and patient watchings at the small opening that communicated with her father's dungeon, feelings of noble and virtuous admiration arose in his heart, which he felt ashamed to avow to his companions. It was in one of these moods that he encountered poor Barbara, who, absorbed in grief, was for some time totally unconscious of his presence. He endeavoured to get her lodged in a house the inmates of which were known to him, flattering himself that this care on his part was disinterested, and merely to enable her to see and visit her father. It was soothing to him to think that his influence might enable her to do so, hoping by that means to detain her longer in Salzburg.

It may be imagined that it was in no mirthful mood that the young baron mingled in that evening's courtly and joyous throng. His pride struggled against his deep love for the simple peasant. He feared that, by displaying his real feelings towards her, she would quickly fly from him, and thus deprive him of the solace of seeing her; and then, again, he thought that perhaps at that moment she might be leaving Salzburg, and going back to her home in the mountains. Von Motzel determined to escape from the party, and ascertain whether Barbara was yet in Salzburg. Watching his opportunity, he managed, unperceived, to leave the house. It was a bright moonlight night, and, taking care to keep in the deep shadows cast along his path by the lofty houses of Salzburg, he hastily pursued his way. He had gone but a short distance when he was suddenly accosted by one of his acquaintances, a cousin of his bride, who now arrested his footsteps.

"Whither away, Baron?" cried he, with astonishment. "How is it that thou hast already left the company which I was on my way to join? Hast thou really been able to obtain the permission of thy betrothed to this defection from her ranks, thyself the foremost of her admirers?"

Von Motzel's vexation at this unwelcome encounter was too strong to be mastered, and he answered sharply,—

"I felt unwell, and I have therefore come out to breathe the fresh air; a short walk, hope, will remove my illness, and restore me to her company."

"Oh, then, permit me to attend thee," returned the other; "I hope, by that means, to merit the thanks of thy beautiful mistress. For alone thou mightst fall into a swoon, and be plundered by ruffians, or even worse might happen."

"No, no," said Von Motzel, irritated by this frustration of his plans, "I could not think of detaining thee from such a scene of gaiety."

"But I shall doubly enjoy it," said the young man, "if I take thee back with me; make no compliments, therefore."

Wishing the troublesome fop at the bottom of the sea, Motzel proceeded, accompanied by his tormentor, who followed him like his shadow. Irritated and perplexed, he at length stopped before the house in which he had placed Barbara.

"Herr Rhelingen," he said, addressing his companion, in a voice almost choked with anger, "have the kindness to wait for me here a short time. I find that the fresh air has not removed my indisposition: I wish to consult my physician, who lives in this house."

"Thy physician, Von Motzel! What! in this house?" said the other, with visible incredulity—"thy physician lodging in so mean an abode? Hear me, Baron," said the youth, seizing fast hold of him, "I know the character thou bearest. Thine evident confusion and vain attempt to deceive me by a falsehood convince me that thou art engaged in some evil design. I will denounce thee as the vilest of human beings, if thou presumest to enter this dwelling. It is full time that now, on the eve of thy betrothal, thou shouldst abandon thy bad mode of life. Give me thy word of honour that thou wilt, and I will accept it."

"This to me," fiercely answered Von Motzel. "In despite of thy doubts, I will not thus be dictated to by thee."

"What then, shall I publicly declare thee a scoundrel?" said Rhelingen.

"Yes," reiterated Von Motzel; "even a dishonourable knave, if it pleaseth thee."

"Ha!" said Rhelingen contemptuously, "I had forgotten that no really noble blood flows in thy veins. Nothing but the ink of the *ci-devant* clerk sluggishly circulates in them. Dead to all sentiments of honour, thy patent of nobility was engrossed with the blood of the peasants whom thy father ground down to squalid poverty. Perhaps this may rouse thee from the mire of thine abjectness."

With these words, he inflicted a severe blow on Von Motzel's face, who, now foaming with rage, drew his sword and ran his insulter through the body. Uttering a piercing cry, Von Rhelingen fell heavily to the earth, and the young baron, his weapon covered with blood, fled into the house before which the quarrel had occurred. An alarming tumult arising almost instantly in the street, he rushed through a back door which was open, and in a few minutes afterwards his horse's hoofs were heard resounding across the wooden bridge of Salzburg, as he hastily galloped out of the city.

At the end of the bridge he saw two persons sitting in the mild moonshine in earnest conversation. Little did he imagine that one of these was Barbara. When the hostess had left her, she had opened the window of her small apartment, and stood before it, enjoying the

coolness and freshness of the night air. The sight of the full moon, which poured its soft radiance in a flood of light upon the quiet little room, caused her to yearn with maternal tenderness to once more behold the child she had left behind. And then she thought of her faithful Hans, who, she knew, was at that moment searching for her in all directions with the deepest anxiety. She thought of her mother and brothers, who were hourly expecting her return. Then the image of her imprisoned father presented itself to her mind. Torn from her family, excited by her tender affection for them, and hoping to obtain some fresh intelligence of her father, she quitted her apartment. She had not advanced far into the passage of the house, which her grief and utter prostration of strength had for two days prevented her leaving, before she felt her dress gently pulled, and heard the timorous voice of a young woman who whispered, "Escape quickly."

Barbara would have asked an explanation, but the earnest voice only repeated the urgent advice to escape at once.

"You will not be able to see your father," added the girl, as if knowing the secret of Barbara's unwillingness to leave; "the prisoners are adjudged to perpetual imprisonment. Save thyself."

With grateful thanks, Barbara took leave of the young girl, and quitted the city. But she had not walked more than a short distance out in the friendly moonshine, anxiously seeking for a path which should lead her to Salzburg, before a lonely traveller was advancing rapidly towards her. Oh, joy, it was her Hans! After the first burst of delight at their reunion, and heartfelt thankfulness to Providence for the peril she had escaped, the faithful pair, so happily reunited, proceeded on their homeward journey. It was this pair that the baron saw as he galloped across the bridge.

CHAPTER XIV.

THE papers which were found upon the prisoners, and which proved, without doubt, that many thousands had embraced the Protestant faith, occasioned no small consternation at the court of Salzburg. Above all things it was deemed necessary to ascertain whether the long list of signatures were voluntary, and whether the refractory subjects were really so numerous as they appeared to be from the documents. It was not thought advisable to employ force, therefore recourse was had to artifice. The crafty Chancellor Jerome, Christian Von Rall, together with Von Rhelingen, marshal of the prince's household, and one secular, therefore repaired to the several wardenships of the mountains, promising redress to all who could allege well-grounded causes of complaint. On the 15th of July, 1731, they arrived at Werffen, where multitudes of the peasantry, continually flocking to them, declared, in the full confidence of faithful hearts, their discontent at the intolerable fines of the judicial tribunals, and at the oppressive charges for funerals, as well as other ecclesiastical demands. These three distinguished personages behaved so kindly and affably towards the complainants, who had been accustomed only to the contemptuous treatment of their wardens, that they soon won their confidence. At length Von Rall put the question to them, whether it was true that many of them had determined to forsake the church which alone afforded the means of salvation. After some hesitation the principal spokesman answered that they all belonged to the Catholic Church, but that perhaps some of them might be inclined to pass the pale. On being desired to express themselves in less figurative language, Ruprecht Stuhlebner drew a

paper from his bosom, which he presented to the chancellor, explaining that it contained their general confession of faith.

"But, my children," said Rhelingen, "you must candidly inform us whether you mean to be Catholics, Lutherans, or Reformers; for these three religions, according to the Westphalian Peace, alone can have free exercise in Germany, and the emperor himself is bound to protect them. Or have you a new confession of faith entirely your own?"

All now voluntarily acknowledged themselves to be Lutherans, and, on the report being circulated of the parley which had taken place, the people came flocking together from all directions. They came in such multitudes from every mountain, every valley and ravine, that in the wardenship of Werffen alone three thousand one hundred persons were registered, and their possessions, as well as their names, were all carefully noted. In all the wardenships there were 20,678 individuals of all descriptions who professed themselves desirous of embracing the new faith.

Encouraged by the specious assurances of the chancellor, the population of Salzburg no longer concealed their true sentiments. And when the prelates and Jesuits reviled and execrated their religion more bitterly than ever, they totally absented themselves from the churches, so that, on the day of the Assumption, only three persons attended the service in Wagrain. From that time the priests were to be seen speeding from house to house in order to recall their erring flock by means of menaces and opprobrious reproaches.

For the purpose of maintaining a steadfast perseverance in their resolution, the whole of the Protestant communities delegated one hundred of their number to assemble in the market-place of Schwarzach. It was on the 5th of August, 1731, that the deputies, in the name of their constituents, bound themselves by a solemn oath to abide in their faith, and therein to live and die. On a table was placed a vessel filled with salt, out of which all the deputies took a portion and swallowed it, as a visible sign of their union, which gave to this act the name of the "SALZBUND," or Salt Alliance. With prayer, singing, and reading the forty-sixth psalm in the version of Luther, the meeting broke up.

The archbishop, who had not naturally a cruel heart, although imbued with the deepest fanaticism of the times, felt a truly paternal affection for his subjects, and was shocked when he reflected on what he called the error of their ways. The most exaggerated reports were repeated to him respecting the public defection of the heretics, and they operated on the weak mind of the prince so powerfully that he became much alarmed, not only for his own safety, but also for that of the Catholic part of the population. He therefore entreated the aid of the emperor against his rebellious subjects, and even despatched Count Hannibal Von Thun, and the warden Sigismund, Baron Von Rhelingen, to Vienna, to negotiate for a force of one thousand troops.

It was rumoured the heretics intended to surprise the capital, and massacre all the Catholics; for this purpose, it was said, they were to obtain possession of the arsenal in Radstadt, and of all the castles that were fortified. To defeat this supposed project the fortifications of Hohen-Salzburg were speedily repaired; the pass and fortress of Lueg, together with the arsenal at Radstadt, were garrisoned; and, in addition to these preparations, the neighbourhood of the castles of Werffen, Golling, Goldegy, Tarenbach, Mittensill, and Hirschbühler, was cleared of the circumjacent houses and

trees, except some of the highest of the latter, preserved for the purpose of placing torches, which, when lighted, would serve as alarm-beacons on the outbreak of the looked-for rebellion.

In the mean time, the country people, relying on the unquestionable justice of their cause, and the aid of the Protestant princes, sent messengers to Ratisbon with renewed applications. The negotiations into which Von Schonberg, the Saxon ambassador, entered with Von Ziller, the ambassador of Salzburg, are remarkable; for the latter could not by any persuasion or argument be induced to exhibit answers on the part of his sovereign in his own handwriting, for no other reason than because it was the custom of the Protestants to print all their proceedings that were of a public nature.

As soon as the archbishop received assurances from the emperor that he would grant the aid which he had requested, he laid aside the condescension which he had hitherto shown, and issued a proclamation against the insurgents of Salzburg, threatening them with immediate expulsion if they did not return to their ancient faith.

The Protestants, however, continued undaunted; ridiculed the edict, calling it the "new salute from the Pope," and would not permit it to be affixed to the doors of their houses.

WHEN THIS OLD CHAIR WAS NEW;

OR, DOMESTIC LIFE IN THE GOOD OLD TIMES.

"FULL humble were their meals,
Their dainties very few:
'Twas only ground nuts, clams, and eels,
When this old chair was new.

"Their greeting very soft,
'Good-morrow' very kind:
How sweet it sounded yet,
Before we were refined.

"Humility their care,
Their failings very few;
My heart! how kind their manners were,
When this old chair was new."

So felt the descendants—or one of them at least—of "The Pilgrim Fathers;" and thus he wrote on William Brewster's chair—a relic of their primitive life in the land of their exile.

As they grew and rooted in the soil, and prospered and became rich, their hearts lost that strong attachment which a fellowship in suffering begets. There were divisions and strifes; they were "refined," and their "very kind good-morrow," elegantly expressed now, lost its earnest cordiality; their "failings" increased with their possessions, and their "humility" did not prosper when good dinners superseded "ground nuts, clams, and eels." Thus thought the poet of the chair, no doubt not altogether without reason.

But in the past, mellowed by distance, harsh colouring and rude outline are lost. We compare it with the present, and the present fares hard with us. Look on *that* and on *this*, we say; where is the simplicity, where the truth, where the geniality of olden times?

There was necessarily much less of artifice and churlishness and other evil things among the Pilgrim Fathers than afterwards appeared in their children; for their numbers being multiplied, so were their corrupt tendencies. But the poet of the chair, if he had made this allowance for increase of population and its inevitable effects, might have found under the guise of advanced civilisation (the result of prosperity) as

much in comparison to admire as in "the ground nuts and eels" time. A special purpose bound the settlers to act in harmony and merge separate interests in attaining one great end; that end had been attained, and now there was breathing room for individual concerns; but the stern curb which had restrained the appearance of self was self-love exhibited (through circumstances) in a highly respectable form.

It is a way we have, of grumbling at what is, and fetching unfavourable contrasts, from memory we think, but more truly from imagination.

"When I was a boy," says a grandfather; "When I was a girl," says a grandmother; and remarks follow which ought to impress the hearer with a sense of shortcoming and shame, such wonderful things were said and done in the days of the past.

"Such servants as there are now," says a mistress; "they do no work, think of nothing but dress and pleasure, and the wages: wages are really fabulous!"

The charge is unhappily true of many who call themselves servants; and the mistress will go on and say, "Formerly, a girl would be ashamed to be seen with long sleeves except on a Sunday; she could clean and cook and wash and brew and bake, she was up with the lark and went singing through her work, and didn't mind taking a turn at the spinning-wheel, or putting a patch on a housecloth when the evening came. Those were the days!"

Yes, they were the days—but only half the story is told. Servants are altered indeed, but so are mistresses. Let it be remembered that the mistress of a servant who worked in that fashion had no idle life. She was in the forefront and thick of all the work herself: the servant followed in her wake, and didn't object to labour under, not orders only, but good guiding. So the complaint should go on, and tell how mistresses then knew how to teach a servant, and set a good example, could themselves take a hand in cleaning, cooking, brewing, and baking, and not fail at the spinning-wheel or needle in the evening. The fault is not in nature. Servants now are made of the same material as they were then; it is the state of society that makes the difference in them and in their mistresses. Most of the mistresses who complain that their maids cannot work and will not, are unable to show them how, and unfit for the exertion. The very same increase of "refinement" that spoils the descendants of the Pilgrim Fathers, has spoiled them and their maids. Neither in mind nor body are either of them, as a class, equal to the good old days over which our grandmother housekeepers sigh.

Education, dress, diet, amusements, are all of another kind in both classes. But the leading fault is in the higher class. The changed mistress has changed the servant. Let us go to the root of the matter. Can it be expected that a young person whose father, being in respectable circumstances, has been able to give her what is called "an education"—but such only as has in it no useful elements scarcely but those of reading and writing (for all who are able to judge will allow that the prevailing education is very superficial)—is fit to be a mistress? Yet how many are? Her thoughts have been driven by trifling pursuits from home duties; she is more in earnest about the adornment of her person than any other thing. She is fond of amusements, she thinks scribbling in albums, or writing letters, or doing fancy work, or jingling on a piano, is her proper occupation, and expects her servant, who has shared in the altered training of the day, and knows nothing of work, and only wants to get out of it as much as she can, to

do all her duty, to keep her in ease, and cleanliness, and comfort, by her own undirected efforts. And while she who, being a ruler, ought to be a guide, leads a life of idleness, she is angry, and surprised that her maid admires her notions of what is agreeable and is idle too. She is displeased with the excess of her dress, and justly; but the less said on this subject by all the womankind of the present day the better, for the infection of over-dressing has so thoroughly spread, that to determine on any distinction of rank or circumstances from the manner of dress is impossible. The maid sees her mistress, whose husband is perhaps in any but affluent circumstances, dressed as handsomely as the wife of the opulent goldsmith or the rich banker: and it naturally follows that she goes to the extent of her wages (and demands a rise upon them too), that she may vie with these ladies' maids.

But the mistress will tell you that the girl actually leaves her dishes unwashed that she may answer a letter in time for the post; that she will not work at her needle even to keep her own clothes tidy, but spends every moment she can steal from her neglected duties in her voluminous correspondence. No one will deny that the bright side of the penny post has its dark reverse. A farmer's wife complained that her "girl" would leave the cows to run after the postman's cart; and that, while she was almost bare of clothing, she would expend a little fortune on "envelopes and paper" whenever an itinerant vender came in her way.

But this is only a feature in the evil face of the idle life which example seems to justify. There is another—the mistress is indignant, shocked: she finds a novel in the kitchen drawer—one of her own library books—together with some publications of a very objectionable nature. How bad the world has become she cannot find words to tell. She quite overlooks the fact that she has sanctioned such reading by her own adoption of it, and that while works of at least a questionable character lie on her drawing-room table, she has no right to wonder at finding them, or others of a less polite description, but in the same direction, in the kitchen drawer.

"What! am I to read nothing but what my servant is to read?" cries the indignant mistress.

"Oh, yes; you ought to read much that is above her comprehension, that your mind may be trained and strengthened for the honest discharge of all your duties—among them that of a mistress. Whatever pollutes, whatever weakens, whatever in any way deteriorates, you ought to avoid; it disables you from being a faithful and efficient mistress, as the books you find in the kitchen drawer disable your maid from being a faithful and efficient servant."

"Oh!" cries the grandmother again—"Oh, for days when the mornings were spent by young ladies in culling simples, and the evenings at the spinning-wheel or tambour frame; when the pride of a young woman lay in the quantity of home-spun she could show, and not in the endless finery in which she could array her person."

It is not becoming to contradict the aged, so we only cough slightly, and are silent.

"You agree with me, I am sure?" says grandmamma, a little sharply.

"Well, madam, my admiration of simplicity is great; but, if you will allow me to say so, there is a difference between the simplicity of dignity and the simplicity of ignorance (which is not dignified at all). I think those young ladies whom you remember with such approbation, if we may judge from the periodicals of the day, were

not by any means pattern young ladies. They culled simples and spun flax, but those were the staple excellences of their lives. As to their reading, the novels of those days were as offensive to taste and as antagonistic to purity as any can be now. As to dress, remember, madam, their stay bodies and hoops, their trains and embroidered petticoats, their powdered hair and lappets, and their *paint* and *patches*!

"Well, well?" says grandmamma, half smiling.

"Don't you think, ma'am, if the education of the present day were well directed, young ladies, instead of being the worse for it, would be all the better?"

Grandmamma cannot go so far as that. But the truth is, that a good thing is no less good because it is ill applied. Mix gold with alloy as you will, it is gold still, and the furnace will show it to be so. The advance in education in all ranks is no evil in itself; the evil is in the imperfection of nature, and in the father of evil, who is ever on the watch to turn a fresh movement to account.

If we could go back to those days of virtuous, industrious, and simple-minded young ladies, we should see but few in comparison of such as we expected to find, and when we had found them should most probably think they would have made better companions to a husband, and guides to children and servants, if they had been better educated, *i.e.*, enjoyed the advantages of this day; and those miracles of servants, those paragons—not to be spoken of without a groan—it is a question whether many would be met with (if we were landed in those golden times) that would not shock us by their coarseness much more than delight us with their excellence, especially when we found that they would no more "run alone" than the damsels of the present day. No, if we are to go back, let us fly farther.

There is a servant described in an old book, where the truth is told without exaggeration: his name was Eliezer of Damascus. You may read his history a thousand times, and always when you rise from it bow with respect to his memory, and wish you could find such a servant now. But who was his master? Why, Abraham, who commanded his household and his servants after him, to keep the ways of the Lord. Eliezer had been trained by his master—by precept and example—to pray, to serve in the fear of God. Then, as now, this training was infallible in its results.

There is a portrait which, for symmetry, for grace, for loveliness, exceeds all that the masters of old ever painted; it is called, "The Excellent Woman." Let any young lady read that, pray that it may be her rule, study to make it so, and she will leave her grandmother little to complain of. Neither her husband, nor her children, nor her servants, will want to go back to the wonderful days of simple-culling, tapestry-working gentlewomen to find a wife, mother, or mistress. "She looketh well to the ways of her household, and eateth not the bread of idleness. Her children arise up, and call her blessed; her husband also, and he praiseth her."

Many do not look at all, many look only to find fault; but she looketh, and looketh well.

Times change, manners and customs change, our wants and desires, chameleon-like, taking a colour from a changed society, change too. There is, however, no change in the golden rule for the making of an excellent wife, mother, and mistress found in the last chapter of Proverbs. As the women in the patriarchal times followed it, as the ladies of our grandmothers' regrets followed it, and as the ladies of this day follow it, so peace reigned and reigns in their hearts and in their house-

holds. In this universal outcry against servants there are such peaceful homes to be found. Happy the mistress who reigns in such a one, happy the servant who serves!

SPANISH REVOLUTIONS.

We see as yet only the beginning of the end in Spain. One thing is certain, that any change must be for the better, compared with the state of affairs in the beginning of this year. When things are at the worst, there is some hope of mending, and never was nation more degraded than Spain at the close of 1867, when a public journalist thus wrote:—

"Notwithstanding wholesale transportations to the Philippines and to Fernando Po, the citadels of Cadiz and Cartagena are described as crowded with liberals chained in couples like galley slaves, after the most approved Neapolitan fashion. The streets of Madrid are startled at the dead of night by domiciliary visits, and the seizure of persons, papers, and all that comes to the *alguazil's* hands. Letters are unsafe at the post-office, not only in the kingdom, but even in the colonies, whither, as we see from a late announcement, our own authorities at St. Martin's-le-Grand have ceased to forward registered letters, as the Spanish Government refuses to give receipts. Taxes are exacted for a whole twelvemonth in advance, and all sorts of tricks are played with the bank and the funds, that convents and nunneries may be indemnified for the spoliation they endured at the hands of Mendizabal's Government. The King-Consort, the Bishops of Avila, Burgos, and Segovia, together with Father Claret the Confessor, and the Bleeding Nun,* constitute the *Camarilla* in whose hands the chief minister and his colleagues in the Cabinet are mere tools.

"It is hardly to be believed how completely the clerical element has crushed not only the civil, but even the military order. It is true that the fidelity of some of the generals is constantly stimulated by the most unbounded lavishness of ranks and honours; the promotion of such a man as the Marquis de la Pezuela has been so outrageously rapid as to shock the *esprit de corps* even of those staunch loyalists, Pavia and Concha; but no amount of Royal bounty, well or ill bestowed, will ever cure the disaffection rife among the troops. Between O'Donnell and Narvaez every regiment has been 'swept clean' of its non-commissioned officers. At a review lately held in Madrid the artillery came to muster 'without one single sergeant in the ranks.' We do not know to what extent the Queen may win the hearts of her subjects by the patronage she extends to the fine arts; but we are told that on her saint's day she conferred the title of Viscount de Molina upon Obregon, a well-known comic singer of the popular theatre La Zarzuela, a man who, by her liberality, has been for the last two years enabled to keep up a style of luxury and grandeur which has caused flagrant scandal. For his own part, the King-Consort was equally anxious to remunerate the private services of his favourite, Meneses, by proposing him for the honours of a ducal coronet."

Narvaez and O'Donnell were the latest military rivals

* After the flight of Queen Isabella, Sir George Bowyer attempted a defence of Father Claret and Sister Patrocinio, his letters, as usual, confirming the public belief in what he denies. Every Spaniard knows that the Royal Confessor exercised baneful influence, and that "the bleeding nun" was convicted as an impostor, pretending to have the marks of the Saviour's wounds.

for power, but there seems to have been before them a perennial contest among the heads of the army. It was only when the chief of these were dead or banished,

A GALLICIAN (*Gallego*) WITH BAGPIPE (*gaita*).

that the Government was left for a time to the miserable rule of Gonzales Bravo and his clique, whose insolent conduct roused the spirit of revolt.

PEASANT OF ARAGON.

Since the death of Ferdinand VII, in 1833, the nation has been in perpetual disturbance. There was first the war of Zumalacarreguy, who, with Torreguy and other

chiefs, proclaimed Don Carlos. In 1835 Cardero endeavoured, at the head of a battalion, to substitute the Constitution for the Statute. In 1836, 3,000 men of the garrison at Granja, at the orders of three sergeants, compelled Queen Christina to take an oath to the Constitution of 1812. In 1838, it was the turn of Narvaez and Cordova, who attempted at Seville a retrograde movement which failed. In 1840, the army, under the orders of Espartero, pronounced against the Regency of Queen Christina. In 1841, a movement in her favour took place at Madrid, Pampeluna, and Saragossa. In 1843, there was another, in which Generals Serrano, Prim, Ortega, and Narvaez joined. In the same year, Catalonia endeavoured to establish a central junta. In the early part of 1844, Alicante declared in favour of Espartero. Some months after, General Zurbano tried to restore the Constitution of 1837. In 1846, all the garrisons of Galicia united in favour of the same object, which had replaced that of 1812 in the hearts of the insurgents. In 1848, Catalonia strove for the same end.

HONEY-SELLER, MADRID. "*Miel, miel, blanc-a-c.*"

In the month of May of that year the Commandant Buceta, at the head of the regiment of Spain, caused some disturbances. Two months later, a battalion and three squadrons appeared in arms in Seville against the Constitution of 1845. In 1854, Brigadier Horé, at Saragossa, at the head of his regiment, made a special pronunciamiento of grievances, but was put down. On the 28th of June, Dulce and O'Donnell disembarrassed the throne of the Camarara which dishonoured it. In 1856 it was the turn of Commandant Corrales, who proclaimed Charles VI at Saragossa. In July of the same year, General Rios, commandant of Gerona, pronounced in favour of the constituent Cortes. Several other movements took place with the same view. In 1859, some sergeants of Alicante and Seville were executed for endeavouring to establish a republic. In 1860, General Ortega, Captain-General of the Balearic

Isles, proclaimed the reign of the Count de Montemolin. In 1865 took place at Valencia a movement, the leaders of which had not time to issue a programme. In 1866 came on the affair of General Prim, which terminated

FATHER CLARETÁ.

unsuccessfully, and drove him to the exile from which he again lately emerged.

What will be the upshot of recent changes no one can guess. There is something rotten in the state of

SISTER PATROCÍNIO, THE BLEEDING NUN.

Spain. There must be some element of national life wanting. We have heard of the army and its generals, of the grandees, of the church, this time of the navy, and always too much of the Queen and of the Court.

Throughout the country is there no middle class? Is the love of freedom utterly trodden out? It may be that Spain now is bearing the bitter retribution of past crimes. The inquisition quenched the light of truth, and when a nation is without religious liberty there is no deep soil for civil freedom. With a constitutional government, a free press, popular education, and above all an open Bible and the spread of Christianity, there might yet be hope even for Spain.

CHARACTERISTIC LETTERS.

COMMUNICATED BY THE AUTHOR OF "MEN I HAVE KNOWN."

SAMUEL LOVER.

To preserve some authentic features of self-drawn character, only throwing in what might be needful as a light upon them by anecdote or brief comment, is the object of these papers; and either for personal interest or literary curiosity, it would be difficult to find a subject more worthy of selection than Samuel Lover. Of men whose memories will live after contemporary hurrying and noise have passed away, I claim an honoured position for my lately deceased and lamented friend. It is true that he has been popular; but has his fame or his substantial reward been equal to his merits? In my humble opinion, so far from it, that I recognise few individuals within my sphere of observation to whose rare and varied talents less justice has been done.

From some cause not readily explicable, Mr. Lover, like Edward Bulwer, now Lord Lytton, was assailed on everything he produced, and persecuted to the best of their abilities by the same critical clique and their allies. Bulwer had conscious power in him, so that he rose the greater from their persevering enmity, whilst Lover, not so powerful, though he did achieve a name in literature, had his success so much marred by their hostility, that he failed to reap the harvest and to reach the station due to his deserts.

Keenly did Lover feel his injurious treatment with every novelty he produced. Even his latest musical drama was driven off the stage by a pre-determined opposition, and with sorely wounded heart he wrote, complaining of the unfairness of the attack:—

I thank you [he writes to me] for your sympathy in my mishap. . . . British fairplay seems forgotten, and we have fallen on currish days, I fear, in our modern journalism. My well and fairly earned reputation should have been sufficient to protect me from the *blackguardism* that has been exercised against me. I am safe, however, from such paltry attacks. They cannot rail the seal from off my bond. This mosquito bite is nothing, when I think of the grief that smote my heart this morning, seeing the announcement of my most dear friend Edward Forbes' death. I cannot tell you how bitterly I feel his loss. Another of my dearest and closest friends gone.

When true hearts are withered, and fond ones are flown,
Oh! who would inhabit this bleak world alone?

We can't make *old* friends—and at our age new ones are not good for much—they *don't fit*.

Yours, ever truly,

SAMUEL LOVER.

Some hard words occur in this letter, but they speak the impulsive sensibility of the poet, and are natural to all men of talent whose hopes are cruelly crushed by rash censure or unjustifiable prejudice. The peccant matter disposed of, it affords a melancholy pleasure to have the genuine character of the man himself before us—the brief lament for the loss of a valued friend by the author of "The Four-leaved Shamrock." See how he would "weave his spells" with the "charmed leaves"—not seeking wealth or splendour:—

But I would play the enchanter's part
In casting bliss around;
Oh, not a tear nor aching heart
Should in the world be found.
To worth I would give honour,
I'd dry the mourner's tears,
And to the pallid lip recall
The smile of happier years.

The heart that had been mourning
O'er vanished dreams of love,
Should find them all returning,
Like Noah's faithful dove;
And Hope should launch the blessed bark,
On Sorrow's dark'ning sea,
And Misery's children have an ark,
And saved from sinking be.
Oh, thus I'd play the enchanter's part!

That I should nourish a private affection for this song may well be imagined on perusing the following letter:—

MY DEAR JERDAN,—I think your bonnie lasses were so pleased with "The Four-leaved Shamrock," that they took it home, and as I do not wish you should be without a copy of the trifle that I am so proud and pleased you admire, I send you another copy. I think I know why you like it so much: it is that the expression of good feeling finds an echo in your own kind heart. "The Arab" you seemed to think well of, for the same reason, and so I send you that too.

Yours ever,

Most truly,

SAMUEL LOVER.

Monday, 27, Charles Street, Berners Street.

The warm and large heart of the writer speaks in letters of this description, warm and large as the native Irish heart, and only elevated into richer glow and wider comprehension by the gift of true genius.

When barely of age, in 1818, he attracted the notice and applause of Dublin by singing a song of his own composition in compliment to Moore, at an entertainment given by his friends, and received the poet's graceful acknowledgment of the tribute. From this period his pen was never idle during the years he pursued his profession as a miniature portrait painter, and with distinguished patronage and success. Nor was he less a favourite in the social circles, where his lively conversational talent, his ever ready song, and his recitations of Irish tale or legend, made him always a most welcome guest. The latter were from time to time contributed to periodical publications, and ultimately a first volume was published in Dublin. But it was not till two years later, viz., 1827, that his fame, or even his name, was heard of in London. In the spring of that year Messrs. Sherwood and Co. gave the world "Poetry and Poets," by Richard Ryan, author of "Ballads on the Fictions of the Ancient Irish," in three volumes, and among the selections was one thus noticed in the "Literary Gazette," No. 532, March 31:—"Among the pieces said to be original, the following stanzas, by a Mr. Lover, an Irish gentleman, are pretty:—

THOUGHTS OF SADNESS.

(After two descriptive stanzas, referring to them, he proceeds—)

But though sad 'tis to weep
O'er incurable woes—
Sad the dream-disturbed sleep—
Yet far deeper than those
Is the pang of concealing
The woes of the mind
From hearts without feeling—
The gay, the unkind.

For saddest of any
Is he, of the sad,
Who must smile among many,
Where many are glad;
Who must join in the laughter,
When laughter goes round,
To plunge deeper after
In grief more profound.

Oh, such smiles, like light shining
On ocean's cold wave,
Or the playful entwining
Of sweets o'er the grave;
And such laugh, sorrow spurning
At revelry's calls,
Like echoes returning
From lone empty halls."

And this was the first glimpse of Samuel Lover on the English side of the Channel and in London, where his growing reputation and conscious ambition induced him soon after to establish himself as an artist at his residence in Charles Street, with his prolific pen in reserve for the exercise of his other musical, literary, and versatile powers. The incident above related had led to an immediate acquaintance between us, which speedily ripened into a friendship more intimate, cordial, and lasting than often falls to the lot of humanity. He scarcely ever printed a song without a private rehearsal to gratify me, and he adopted no important affair without seeking my advice. With his manifold pleasurable accomplishments as an author, and his estimable qualities as a man, it is not strange that the attachment of those who knew him well was of no ordinary description. Artist, lyrist, dramatist, novelist, essayist, humourist, musician—he took a fair rank in all, and in song and nationally characteristic tale he has not been excelled.

Settled in London, Mr. Lover devoted himself assiduously to his art, and painted portraits with sufficient success (though not reaching the very highest rank) to remunerate his labours, and yield a competency for the passing day—at all events when supplemented by his literary publications. The second volume of the "Irish Tales" was added to the first; and the ingenious story of "The Curse of Kishogue"—who unfortunately mistook the squire's horse for his own mare—achieved a loud popularity. This favourable opinion was increased by the appearance of the story of "Rory O'More," and of "Handy Andy," in "Bentley's Magazine," though the guinea a page, monthly, was no such encouragement to the author as the liberal remuneration is to popular contributors to the periodical press at the present day. Another lyrical volume followed, and his songs, sung everywhere, sounded the fair fame of the lyrist over the length and breadth of the land. "The Angel-Whisper" had already been among the most popular of his effusions, but throughout a numerous sequel, whether published in volumes or separately with music, there were, at last, a whole series which found echoes in every class and condition of society. Virtuous love, benevolence, pathos, patriotism, and Irish humour, were all delightfully illustrated. From "The Mother's Wail for her Lost Fairy Boy" "The Minstrel," and "True Love can ne'er forget"—an exquisite love-history in a dozen lines—to the laughable Widow Machree, exhorted to follow the example of the

Dear little fish,
If they don't speak, they wish—

there is a wonderful variety; and the whole appropriately winds up with that richest aggregation of Irish despairing passion evaporating in the rapid confusion of mind and evolution of bulls—

My shadow on the wall
Is not like myself at all;
I've grown so tall and thin,
That myself says 'tis not him!

At the close, begging for marriage to

Put an end to all this bother,
When they'd both be one another!

His brief appearance on the stage I mention only as leading to those monologue entertainments which for

years amused the public, both in every part of Great Britain and throughout the American States. One of his letters from Dublin gives an account which is very naïve, and curiously descriptive of the national character a quarter of a century ago, so much the same as it is now.

Dublin, Jan. 24, 1846.

MY DEAR JERDAN,—I start for the south to-morrow, after having my two last nights, of the most triumphant character, highly fashionable and crowded to excess; in short, after the platform being crowded, and all the standing-room exhausted, hundreds went away who could not get admission. I wish I could stay, and make a *run* of the success, but I am engaged to the south, and must only hope on my return my welcome will not have worn out. Only fancy "The Royal Dream," that which you and I fancied would be what the Italians call a *furor*! Not at all. The fact is, the little lady [so they called the Queen] is not popular here with any party; they think, one and all, they have been neglected in not being visited sooner. So I must only hope the spirit of my song will do me good *elsewhere*. But St. Kevin—that's the fellow; no mistake, they *do* like St. Kevin! However, finding my Queen's Visit was not of the catching nature I hoped for, I have done some of my other entertainments, and they are liked; but the judicious—those who know "what's what"—say the Visit is the *best thing* I have done. I worked up the second part *very well*—I think you will say so when you hear it. I don't know if you saw or heard of a furious attack upon me in the "Nation." They "*denounced*" me and my praises of the Queen, and I was blackguarded, body and sleeves; but the rascality of the attack foiled its object. It did me more good than harm. I met Mr. Duffy, the editor, at a public dinner (the *Press* dinner) the day the attack appeared. My health was given with *enthusiasm*. In returning thanks, I made a hit at Mr. Duffy to his face. I was "*cheered*" like anything. I send you the trifle. The "Nation" has been silent since. I think *Vinealy's* dirty work was somehow in it. A man named Barry, of Cork, did the dagger work; but my public triumph here is the best answer. However, that the author of the novel of "Rory O'More" should be stabbed by the "*Patriots!!!*" is too bad.

Yours ever,

My dear Jerdan,

SAMUEL LOVER.

Wm. Jerdan, Esq.

In the autumn of the year he sailed for America, and was applauded and *fêted* (as more recently Dickens) at New York, Boston, and throughout the Union. In 1848 he returned home, and resumed his entertainments with American bits and other novelties. But as this sketch is not a biography, I pass over his epistolary descriptions of his transatlantic successes, darkened by the lamented death of his wife at home, and anxiety for his two orphan daughters.

Three years ago, having sought retirement and repose at Sevenoaks, Kent, he suffered a dangerous attack on the lungs, and was with difficulty restored, to seek Jersey as a change. There he died, and the body was brought to be interred in Kensal Green—being met and attended by the London Irish Volunteers. And well he deserved the honour; for he was a fine type of the loyal, liberal, warm-hearted Irishman, richly gifted with delightful talents, ready witted, and amusing in social life, and above all sterling and honourable in principle and conduct. I cannot bear to dwell on our long, unchangeable friendship and mutual attachment; but my readers can have no deep sense of my grief for his loss, and I will bid farewell with a cheerful letter, among those of my latest dates.

Sevenoaks, Jan. 13, 1865.

MY DEAR JERDAN,—I have been not very well since I had the pleasure of receiving your last letter, and I do not expect to be much if any better as long as the cold weather lasts.

All you say of the — Club is quite true. We may quote the lament of Ophelia—

See what I have seen—
See what I see!

"'Twas a pleasant place once upon a time," as the nursery tale initiates its pleasantries.

Had it continued to be pleasant, it would have cost my self-denial more than it has done in taking my name off the list of members. Well, grumbling is no use, so "there an end," as Mr. Pepys says.

I send a photo-proto-type of a owld sojer boy, for Mop [his god-daughter]. I am only an honorary member of "The London Irish" now, but I was one of the first to drill in Company No. 1, when the corps was first established, and I have "*marched through*" London with them. Now don't think of *Coventry* when you read "*marched through*."

Why should so old a fellow join the volunteers? I'll tell you why, as far as I am concerned. Ireland was behaving so badly at that time, and about that grand movement, that I thought it incumbent on every Irishman in England with a spark of gentlemanly feeling and loyalty in him, to enrol himself among the volunteers. And now good-bye for awhile, dear old friend.

Yours, very truly,

SAMUEL LOVER.

THE CHINESE EMBASSY.

If the rulers of the Flowery Land have sent an embassy to the English barbarians, they will be received with all due welcome. John Bull will be very happy to see John Chinaman. Let bygones be bygones. For three centuries the English merchants have been left to be bullied at outposts by insolent mandarins. English envoys have been exposed to humiliation and treated with trickery. But things are changed since the capture of Peking and the embassy of Lord Elgin. If the present embassy is a genuine affair, it shows a wonderful progress in Chinese life, and should be met in a spirit of amity and conciliation.

But is it a genuine embassy? A clever American is at the head of it.* An Irishman "plays second fiddle." They are accompanied by a retinue of Chinese interpreters and officials. There are two mandarins, but not of very high rank, and the others are ordinary Chinese scholars not receiving large pay. When we consider the enormous extent and wealth of the Chinese empire, this mission appears a paltry affair to represent her grandeur at the courts of Europe, especially if compared with the British embassies to the court of Peking. Moreover it is noticeable that they bring no presents to the monarchs to whom the envoy is accredited. This omission is significant, as, according to Chinese etiquette, no ambassador could have audience without bringing costly gifts to the emperor; so that cannot be considered a true embassy which does not bring some valuable presents to our Queen, or the Emperor of the French. But then, if they did so, it might be said that the mighty Emperor of China had fallen so far from the high estate his predecessors held as the supreme rulers on earth that he sent *tribute* to the barbarian princes of the west, the presents of all ambassadors being so named to show the supreme grandeur of the Chinese emperors. Under these circumstances this cannot be considered an embassy representing the court of Peking, and may be repudiated by the emperor if the mission fails in its object.

However this may be, it is useful to recall the state of matters between China and other powers, since the treaty of Lord Elgin. Before that treaty was signed,

* We have been favoured by the Chinese Ambassador with the following note relative to the names, the quality, etc., of the different members of the embassy:—I. Poo An-Chen (Hon. Anson Burlingame); Choong-Kwo Chin-Chai Ta-Chen. II. Chee Kang, called Chee Ta-jin. III. Sun Chah-Kuh, called Sun Ta-jen. Secretary, Poh Choh-An (John McLeavy Brown, Esq.); Secretary, Teh Shen (Monsieur E. de Champs). Student Interpreters—(1) Lwan Fang; (2) Tah-keh-shi-nah; (3) Foong Ee; (4) Teh Ming; (5) Kwai Yung; (6) Ting Chuen.—*Flying Dragon Reporter*.

in 1858, the only western nation which had a representative at the court of Peking was Russia, in right of her Asiatic territories bordering on the Chinese empire. All other nationalities approaching China by the seaboard held their intercourse with the Government through the provincial authorities at the ports open to foreigners. From this cause arose the constant quarrels between traders and native officials, and the continued hostilities of the naval and military forces sent out to protect our trade. It was obvious that this state of affairs would remain with its evil results until such time as England and France should have representatives at the court of Peking. Accordingly this was provided for in the treaty of Tientsin; but it cost a war, which upset the government, and accelerated the death of the late emperor.

The success of England and France in this matter led the way to the appointment of an American minister, who secured all the privileges of the belligerent powers without incurring any warlike expenditure on the part of his own country. Lord Elgin's policy in enforcing the articles of the treaty for a British representative at Peking, as the only remedy for maintaining pacific relations, is proved by the result that hostilities have not once been renewed since, and our relations with the Chinese were never on a more amicable footing than they are at present. There are now thirteen treaty ports open to foreign trade; and if any disputes arise between the foreign merchants and the local authorities they are referred to the Central Government and ministers at Peking for their decision. Many such have occurred, and if there had been no access to the supreme authorities, in all probability we should have been again at war with China, maintaining costly naval and military forces to enforce our demands.

Meanwhile the personal intercourse of the foreign ministers at Peking with the high state officials, more especially Prince Kung, uncle to the juvenile emperor, and head of the Foreign Office, has had the effect of enlarging the political views of the Government, and showing them the defects of their own national polity as compared with western civilisation. They saw the deficiencies of their system of education, and, to their credit be it said, candidly acknowledged them by instituting a college at Peking for the education of native youth by foreign professors in the arts and sciences. It must be admitted, however, that their greatest anxiety has been to train up their students in a knowledge of those arts that instruct in the manufacture of implements and munitions of war, in order that they may be qualified to superintend the factories being established for such purposes by foreigners in the provinces. Of the general scope of the institution, and the nature of the classes, with the reasons given for departing from ancient custom for modern practice, we find a full statement in the memorial presented to the emperor by the members of the Foreign Board, praying for the foundation of the college. "It is not impelled by a sentiment of blind admiration for knowledge of this kind possessed by Europeans, nor by an extravagant love for novelty. The reason is that in reality the construction of machines for warlike and industrial purposes, so important in our days, is based entirely on the sciences. China wishes to construct her steamboats for herself; but to enable her to do so European masters must initiate her in the principles of the mathematical sciences, and point out the course to pursue. It would be a mistake and a fruitless expenditure of labour and money to hope that the Chinese could attain such a result by their imagination alone. To those who may say that

China humiliates herself in seeking instruction from foreigners, we shall reply that if one thing in particular can make a nation blush, it is to be ignorant of that which others know." These sentiments are honourable to the memorialists as indicating the true spirit of progress.

Having so far adopted the educational institutions of foreigners, the step naturally followed to conform to some of their political institutions upon the earliest occasion. An opportunity has occurred this year in connection with the treaty of Tientsin, which the Chinese have availed themselves of. That treaty, we have stated, was signed in 1858, and it contains a clause providing for its revival after the lapse of ten years. As the period approached, there were numerous discussions by the chambers of commerce at the treaty ports, upon the articles that should be revised, and additional clauses were suggested to give foreigners increased privileges in trading throughout the interior, in opening up mines, and constructing railways and telegraphs. In these proposed alterations of the treaty, the British residents took the leading part, embodying their views in memorials to Sir Rutherford Alcock, our minister at Peking. At first it was intended that the revival of the treaty should be executed in China, where it was made. But the Chinese authorities took alarm at the sweeping changes proposed, and they resolved to submit the question to the treaty powers themselves, through an envoy accredited by the emperor to the European courts. This was acquiesced in by the foreign ministers, as it would relieve them from an onerous and disagreeable task.

At this time Mr. Anson Burlingame was American minister at Peking, and had made himself unusually friendly with the Chinese Government on account of his leaning towards the nation in his diplomatic intercourse. He was also on the best of terms with his colleagues, and had acted impartially as arbiter in difficult matters of diplomacy to their satisfaction. In December, 1867, he was proceeding to visit the treaty ports prior to resigning his appointment, when a farewell dinner was given to him by Prince Kung, at which he expressed regret at his leaving China, while a minister of state named Wenseang asked if he would represent the Chinese Government officially at Washington and the courts of Europe as their envoy. To this he agreed, and the embassy now in England was formed.

When it was officially announced in China that an embassy would proceed to Europe with the late American minister as ambassador, much surprise was expressed by the British residents, and the subject was freely discussed in the local newspapers. Some looked on the mission as a job got up by the foreigners in the service of the Emperor of China, who are supposed to be hostile to the interests of British and other foreign merchants and bankers, through whose hands the external commerce of the country passes in exports and imports to the value of more than fifty millions sterling, and paying duties to the Chinese treasury of the high annual figure of £2,700,000. The reasons advanced in support of this supposition are connected with the staff of employés in the Chinese Foreign Maritime Customs, which was originally instituted by the English and French plenipotentiaries, to raise means in payment of the indemnity moneys which have been levied for the expenses of wars incurred to enforce the demands of the allies. At first the Inspector-General and Commissioners of Customs were, perhaps, more favourably disposed towards their own nationalities than their Chinese masters. But many changes have occurred in the officers of this establishment; and the present In-

spector-General, an Irishman, espouses the interests of his employers as against foreign innovations, with as much, or, as it is alleged, with greater prejudice than if he were a Chinaman. He is a perfect master of the Chinese language, and resides at Peking, where he is in daily communication with the members of the Government, who look upon him as their adviser in all foreign affairs; acting upon his advice, with a promptitude that is all the more remarkable that former Chinese Governments exhibited the most utter contempt for the outside "barbarians"—as Europeans were until lately designated—and their policy. Evidently the secret of Mr. Hart's success is his conservative feelings regarding China, while he advocates the introduction of foreign institutions so far that they will be entirely under the control of the Chinese. This he has shown in his regulations for the commerce passing through the Customs under his control, where he endeavours to check the efforts of foreign traders, especially British merchants, in extending their operations through the country. It is not necessary to enter into the questions that have arisen between them: suffice it to say, that the levying of transit dues on merchandise sent into the interior, besides the Customs duties, is considered obstructive to mercantile interests, and the prohibition against foreigners trading in the interior, with the privilege of working coal mines, and constructing railways and telegraphs, is contrary to the policy inaugurated by the treaty of Tientsin. In withholding further privileges, and abolishing obnoxious clauses in that treaty, the Inspector-General of Customs concurs with his Chinese masters, and opposes their introduction into the revisal about to be concluded. In these views he has been supported by Mr. Burlingame, when acting as American minister at Peking, and in some measure by our own minister, Sir Rutherford Alcock, while the French minister disagreed with them. When the time for revising the treaty approached, it was evident to the philo-Chinese foreigners that their views could not be carried out on the spot without serious disputes with the foreign mercantile community, and there can be no doubt that this mission originally emanated from them, which the Prince of Kung and his coadjutors only too gladly adopted, as in accordance with their traditional policy of delay and obstructiveness.

In April last the Chinese embassy crossed the Pacific in one of the American line of steamers to California, and from thence by way of Panama to New York, where they arrived in May, and were presented to President Johnson at Washington, who received its members at a special audience. Of course it was natural for Mr. Burlingame to visit his native country first, as America is included among the treaty powers with China; and, geographically speaking, it is the nearest state to the empire he is considered to represent. That the ambassador should seek preference for his own nation when opportunity offers is also natural; but no benefit can at present accrue to the United States that is not shared by all treaty powers, as each treaty contains what is generally called the "favoured nation clause," which conveys all the privileges, immunities, and advantages that may have been, or may be hereafter, granted by his Majesty the Emperor of China to the Government or subjects of any other nation.

THE QUEEN'S MESSENGER.

MANY a young man who is leaving school or his private tutors will exclaim, "If I cannot get a commission in a

cavalry regiment or be a paid *attaché* to an embassy, let me, by all means, become a Queen's Messenger. It must be so delightful to be constantly rattling about over the world—visiting strange places, seeing strange people, and meeting with strange adventures—to have to talk German, French, Spanish, Italian, and Russian, all in one breath, as it were; to start away at a moment's notice to the other end of Europe, and to be back again in the course of a few weeks or so." Those who have tried this life assert that a man must have a very strong head and stomach and nerves, that he must possess perfect temper and decision and self-command, that he must be firm and gentle and fearless, be able to stand heat and cold and wet and fog, and bad food and damp sheets; in fact, that unless he possess qualities of which not many men can boast, he will be very unfit for the office of Queen's messenger, however he may be suited to become Lord Chancellor or Archbishop of Canterbury.

My friend Mr. F——,* who had held that much envied post in the Civil service, was seated one evening in his comfortable parlour. The fire was burning brightly—the winter was drawing on—his family were around him, when the usual official missive was put into his hands, directing him to start with important despatches forthwith for the land of the Czar. Friends expected were put off, his portmanteau packed, and a very short time saw him rattling away in the mail coach to Dover, to cross to Ostend. His route lay through Cologne, Berlin, Königsberg, to Koono, on the Russian frontier. Wheels took him thus far, for the railway system had not at that time shot forth its tentacle-like arms to embrace the whole of Europe within its grasp, although on our snug little island it was already coming into existence.

At Koono, where the Kiemen is passed, onward to Luga, to St. Petersburg, the snow having come down and formed a hard frozen road, the carriage was put on runners, and reversing the usual order of things, it was turned into a sort of terrestrial cephalopod by having its wheels fastened on to its head. With snow above, snow below, and snow on every side, the Queen's Messenger reached the giant city built by the great Peter on the mud banks of the Neva. Two or three days were allowed him to thaw and rest, and he was started off to the south of Russia.

Once more he had to take his seat in his travelling sledge, habited in his fur pelisse, with bearskin rugs, and wrappers innumerable, and hot bricks for his feet, for a journey of a thousand miles or more over frozen snow. Still, in spite of the bitter cold, the thermometer many degrees below zero, travelling in Russia is pleasanter in many respects during winter than in summer. In summer there are the heat, and flies, and dust, and rough roads, and rivers to be forded or crossed in ferries or by rotten bridges, and innumerable other inconveniences to be surmounted; while the snow is a wonderful leveller of roads, and the ice forms a trustworthy bridge over every stream. It is possible to drive into a snow-drift and to stick fast; and a break down in the middle of the night of a Russian midwinter is undoubtedly to be dreaded.

My friend had got about three-quarters of the way between St. Petersburg and Moscow, and, there being a moon, was travelling on through the night, when the sleigh driver suddenly pulled up his horses.

"What is the matter—what has happened?" he asked.

* The late F. Fricker, Esq., Queen's Messenger.

"The matter, your lordship, is nothing, except that there is a dead man in the road, and you would not wish me to drive over him?"

"Certainly not," said my friend, leaning out of his sledge. "But are you sure that he is dead?"

"Of course, how could a man be lying on such a night as this in the middle of the road and not be dead?" asked the driver. "I will just draw him aside and gallop on."

"Let me ascertain first whether or not he is alive," said my friend getting out of his sledge. "Help me to lift him in here."

"Oh, my lord, my lord, you know not to what fines and penalties you will subject yourself, should he be dead, as he most certainly is," expostulated the driver.

"Am I to force you, slave, with my stick?" exclaimed my friend, getting angry at the driver's obstinacy. "See, here are the marks of his steps at the edge of the road, where he reeled to and fro before he fell."

"He must have swallowed too much vodka," growled the driver.

"No, he was weary and sleepy, and sank down overcome," answered my friend. "Help me, I say."

Unwillingly the serf helped the obstinate Englishman to lift the inanimate body into the carriage.

"Now urge your horses on as fast as you can, and stop at the first house you reach," said my friend. And he took his seat with the seemingly dead man by his side. He found that the man's hands were perfectly cold, but his heart yet beat, though faintly. Still he was satisfied that the man might be saved if soon attended to, and anxiously looked out for the appearance of a house on the road. At last the sleigh stopped before a small house. He knocked and knocked for some time.

"What is it you require?" exclaimed a voice from an upper window, in a querulous tone. My friend answered that he had a sick man who required immediate attention.

"Impossible!" exclaimed the person from the upper window. "We are Polish Jews, and if he were to die, we should be fined, or imprisoned, and ruined altogether. Drive on, drive; the God of Abraham speed you, but do not ask us to take in the dead man."

"He is not dead, friend, I tell you; and he will live to show his gratitude, if you will receive him; besides, I will pay all expenses to which you may be put on his account, and, moreover, the fine which may be imposed on you should he die," exclaimed my friend. "Here, I will pay both amounts over to you at once, and should that not be sufficient, when I come back I will pay you more. See I have a *poteragenas* (a pass to secure post horses, granted to official travellers) that will convince you that I will be as good as my word; besides, I am an Englishman."

"I am perfectly satisfied," said the old Jew, his heart softening at the mention of a reward. He descended the stairs, and the driver, with the help of my friend, bore the inanimate form of the stranger into the house. Fresh wood was piled up on the stove-fire, the body was rubbed thoroughly all over at a distance, gradually drawing it nearer, and some hot drink was got ready. My friend waited till the stranger had opened his eyes, and shown other signs of life; and he then, leaving in the hands of the delighted Jew a handsome sum, hurried away to continue his journey through the long night. The remainder of his journey was not the less pleasant that he could reflect on the little piece of "Good Samaritan" work he had performed.

Two months passed by. Stern winter still held the whole of Russia in its icy grasp. The Queen's Messenger

was on his return from his far-off mission towards the north, when, as he drew near the spot where he had picked the stranger out of the snow, he recollected the circumstance. It was daytime, and he had no difficulty in finding the house of the old Jew. He was recognised at once.

"Did the man live?" he asked.

"Indeed he did, and has been here several times to inquire for you to express his gratitude," answered the old Jew. "He is a worthy man, and it was providential that you saved his life. He has a wife and large family, who would have been left destitute had he died. He had gone to Kieff to obtain a large sum of money, but, ignorant that he had gained his suit, and having before fallen into poverty, he was returning home on foot, weary and sad, to his family. The letter containing the good news had already reached his house when he returned home. Had he died, the property would have gone elsewhere, and his family would have been left in poverty, so he has reason to be grateful."

My friend could not go out of his road to visit the stranger, whom he never saw again; but it was, notwithstanding, pleasant to reflect that he had been the means of preserving the life of a fellow-being, and saving a large family from poverty, sorrow, and suffering. My friend went on his way rejoicing, and though I have no doubt that he felt he had only done his duty, still that very feeling must have afforded a pleasant and satisfactory glow to his heart as he glided on his homeward way over the snow.

MR. DISRAELI ON THE JEWS.

In his novel, "Coningsby," first published in 1844, Mr. Disraeli thus speaks of his compatriots. The speaker, Sidonia, is a great Hebrew capitalist:—

"The Jews, independently of the capital qualities for citizenship which they possess in their industry, temperance, and energy and vivacity of mind, are a race essentially monarchical, deeply religious, and shrinking themselves from converts as from a calamity, are ever anxious to see the religious systems of the countries in which they live flourish. . . . Every generation they must become more powerful and more dangerous to the society which is hostile to them. Do you think that the quiet humdrum persecution of a decorous representative of an English university can crush those who have successively baffled the Pharaohs, Nebuchadnezzar, Rome, and the Feudal ages? The fact is, you cannot destroy a pure race of the Caucasian organisation. It is a physiological fact, a simple law of Nature, which has baffled Egyptian and Assyrian kings, Roman emperors, and Christian inquisitors. No penal laws, no physical tortures, can effect that a superior race should be absorbed in an inferior, or be destroyed by it. The mixed persecuting races disappear; the pure persecuted race remains. And at this moment, in spite of centuries, of tens of centuries, of degradation, the Jewish mind exercises a vast influence on the affairs of Europe. I speak not of their laws, which you still obey; of their literature, with which your minds are saturated; but of the living Hebrew intellect.

"You never observe a great intellectual movement in Europe in which the Jews do not greatly participate. The first Jesuits were Jews; that mysterious Russian diplomacy which so alarms Western Europe is organised and principally carried on by Jews; that mighty revolution which is at this moment preparing in Germany, and which will be, in fact, a second and greater Reforma-

tion, and of which so little is as yet known in England, is entirely developing under the auspices of Jews, who almost monopolise the professorial chairs of Germany. Neander, the founder of Spiritual Christianity, and who is Regius Professor of Divinity in the University of Berlin, is a Jew. Benary, equally famous, and in the same university, is a Jew. Wehl, the Arabic professor of Heidelberg, is a Jew. Years ago, when I was in Palestine, I met a German student who was accumulating materials for the History of Christianity, and studying the genius of the place—a modest and learned man. It was Wehl; then unknown, since become the first Arabic scholar of the day, and the author of the life of Mahomet. But for the German professors of this race, their name is legion. I think there are more than ten at Berlin alone.

"I told you just now that I was going up to town to-morrow, because I always made it a rule to interpose when affairs of state were on the carpet. Otherwise, I never interfere. I hear of peace and war in newspapers, but I am never alarmed, except when I am informed that the sovereigns want treasure; then I know that monarchs are serious.

"A few years back we were applied to by Russia. Now, there has been no friendship between the Court of St. Petersburg and my family. It has Dutch connections which have generally supplied it; and our representations in favour of the Polish Hebrews, a numerous race, but the most suffering and degraded of all the tribes, have not been very agreeable to the Czar. However, circumstances drew to an approximation between the Romanoffs and the Sidonias. I resolved to go myself to St. Petersburg. I had, on my arrival, an interview with the Russian Minister of Finance, Count Cancrin; I beheld the son of a Lithuanian Jew. The loan was connected with the affairs of Spain; I resolved on repairing to Spain from Russia. I travelled without intermission. I had an audience immediately on my arrival with the Spanish minister, Senor Mendizabel; I beheld one like myself, the son of a Nuevo Christiano, a Jew of Arragon. In consequence of what transpired at Madrid, I went straight to Paris to consult the President of the French Council; I beheld the son of a French Jew, a hero, an imperial marshal, and very properly so, for who should be military heroes if not those who worship the Lord of Hosts?"

"And is Soult a Hebrew?"

"Yes, and others of the French marshals, and the most famous; Massena, for example; his real name was Manasseh; but to my anecdote. The consequence of our consultations was, that some northern power should be applied to in a friendly and mediative capacity. We fixed on Prussia; and the President of the Council made an application to the Prussian minister, who attended a few days after our conference. Count Arnim entered the cabinet, and I beheld a Prussian Jew. So you see, my dear Coningsby, that the world is governed by very different personages from what is imagined by those who are not behind the scenes."

"You startle and deeply interest me."

"You must study physiology, my dear child. Pure races of Caucasus may be persecuted, but they cannot be despised, except by the brutal ignorance of some mongrel breed, that brandishes faggots and howls extermination, but is itself exterminated, without persecution, by that irresistible law of Nature which is fatal to curs."

"But I come also from Caucasus," said Coningsby.

"Verily; and thank your Creator for such a destiny; and your race is sufficiently pure. You come from the shores of the Northern Sea—land of the blue eye, and the golden hair, and the frank brow; 'tis a famous breed, with whom we Arabs have contended long, from whom we have suffered much; but these Goths, and Saxons, and Normans, were doubtless great men."

"But so favoured by Nature, why has not your race produced great poets, great orators, great writers?"

"Favoured by Nature and by Nature's God, we produced the lyre of David; we gave you Isaiah and Ezekiel;—they are our Olynthians, our Philipps. Favoured by Nature we still remain; but in exact proportion as we have been favoured by Nature we have been persecuted by Man. After a thousand struggles; after acts of heroic courage that Rome has never equalled; deeds of divine patriotism that Athens, and Sparta, and Carthage have never excelled—we have endured fifteen hundred years of supernatural slavery, during which every device that can degrade or destroy man has been the destiny that we have sustained and baffled. The Hebrew child has entered adolescence only to learn that he was the Pariah of that ungrateful Europe that owes to him the best part of its laws, a fine portion of its literature, all its religion. Great poets require a public; we have been content with the immortal melodies that we sung more than two thousand years ago by the waters of Babylon and wept. They record our triumphs; they solace our affliction. Great orators are the creatures of popular assemblies; we were permitted only by stealth to meet even in our temples. And as for great writers, the catalogue is not blank. What are all the schoolmen, Aquinas himself, to Maimonides? and as for modern philosophy, all springs from Spinoza.

"But the passionate and creative genius, that is the nearest link to Divinity, and which no human tyranny can destroy, though it can divert it—that should have stirred the hearts of nations by its inspired sympathy, or governed senates by its burning eloquence—has found a medium for its expression, to which, in spite of your prejudices and your evil passions, you have been obliged to bow. The ear, the voice, the fancy teeming with combinations, the imagination fervent with picture and emotion, that came from Caucasus, and which we have preserved unpolluted, have endowed us with almost the exclusive privilege of Music; that science of harmonious sounds, which the ancients recognised as most divine, and deified in the person of their most beautiful creation. I speak not of the past; though, were I to enter into the history of the lords of melody, you would find it the annals of Hebrew genius. But at this moment even, musical Europe is ours. There is not a company of singers, not an orchestra in a single capital, that is not crowded with our children under the feigned names which they adopt to conciliate the dark aversion which your posterity will some day disclaim with shame and disgust. Almost every great composer, skilled musician, almost every voice that ravishes you with its transporting strains, springs from our tribes. The catalogue is too vast to enumerate; too illustrious to dwell for a moment on secondary names, however eminent. Enough for us that the three great creative minds to whose exquisite inventions all nations at this moment yield—Rossini, Meyerbeer, Mendelssohn—are of Hebrew race; and little do your men of fashion, your muscadins of Paris, and your dandies of London, as they thrill into raptures at the notes of a Pasta or a Grisi—little do they suspect that they are offering their homage to 'the sweet singers of Israel!'"

Varieties.

ROME AND THE ROMANS.—The population of the Eternal City, it has been said with equal truth and sarcasm, consists of priests, nobles, and beggars. Within the walls of Rome there is no trade, industry, or commerce of any kind. Such work as may be done here is invariably performed by the mountaineers and provincials, who flock into the capital for employment. The native Romans support themselves by letting lodgings, by selling modern curiosities for antiques, by attending the studios of artists as middlemen between models and painters, or by obtaining the patronage of some priest, friar, or convent. For sordid, squalid poverty the back streets of Rome surpass those of any other European city. The lottery eats up the scanty earnings of the poor; the system of espionage, so universal in Rome, destroys all sense of moral dignity; and the indiscriminate charity of the religious orders removes the only incentive which could drive a debased and degraded populace to honest labour.

BUNSEN'S STUDENT LIFE IN PARIS.—I write from six in the morning till four in the afternoon, only in the course of that time having a walk in the garden of the Luxembourg, where I also often study; from four to six I dine and walk; from six to seven sleep; from seven to eleven work again. I have overtaken in study (Arabic and Persian) some of the French students who had begun a year ago. God be thanked for this help! Before I go to bed I read a chapter in the New Testament, in the morning on rising one in the Old Testament; yesterday I began the Psalms from the first.

PROPORTION OF THE FEET TO THE BODY.—M. Bonomi has been measuring the Venus de Medici. He finds that, allowance being made for her position, her height is about 5ft. 2in. (the actual height of the statue is 4ft. 11in.), while the foot is exactly 9in. long, rather more than 1-7th of the whole height. This does not quite agree with Vitruvius, who gives 1-6th of the height as the proper length of the foot; but it agrees with the measurements of all the best statues. The greatest width of the foot is 3½in.—i.e., 1-18th of the height. Here, then, says M. Bonomi, we have a rule for shoemakers and for shoe-wearers. Any lady who compresses her foot below these dimensions is not only giving herself pain, but is putting herself "out of proportion."

EDITORIAL TROUBLES AND ADVICES.—I am afraid that I may be taxed with insensibility by many of my correspondents, who believe their contributions unjustly neglected. And, indeed, when I sit before a pile of papers, of which each is the production of laborious study, and the offspring of a fond parent, I, who know the passions of an author, cannot remember how long they have lain in my boxes unregarded without imagining to myself the various changes of sorrow, impatience, and resentment which the writers must have felt in this tedious interval. These reflections are still more awakened when, upon perusal, I find some of them calling for a place in the next paper—a place which they have never yet obtained; others writing in a style of superiority and haughtiness, as secure of deference and above fear of criticism; others humbly offering their weak assistance with softness and submission, which they believe impossible to be resisted; some introducing their compositions with a menace of the contempt which he that refuses them will incur; others applying privately to the booksellers for their interest and solicitation; every one by different ways endeavouring to secure the bliss of publication. I cannot but consider myself as placed in a very incommensurate situation, where I am forced to repress confidence which it is pleasing to indulge, to repay civilities with appearances of neglect, and so frequently to offend those by whom I never was offended. I know well how rarely an author, fired with the beauties of his new composition, contains his raptures in his own bosom, and how naturally he imparts to his friends his expectation of renown; and as I can easily conceive the eagerness with which a new paper is snatched up by one who expects to find it filled with his own production, and perhaps has called his companions to share the pleasure of a second perusal, I grieve for the disappointment which he is to feel at the fatal inspection. His hopes, however, do not yet forsake him; he is certain of giving lustre to the next number. The next number comes, and again he pants with expectation; and having dreamed of laurels and Parnassus, casts his eye upon the barren page with which he is doomed never more to be delighted. For such cruelty what atonement can be made? For such calamities what alleviation can be found? I am

afraid that the mischief already done must be without reparation, and all that deserves my care is prevention for the future. Let, therefore, the next friendly contributor, whoever he be, observe the cautions of Swift, and write secretly in his own chamber, without communicating his design to his nearest friend, for the nearest friend will be pleased with an opportunity of laughing. Let him carry it to the post himself, and wait in silence for the event. If it is published and praised, he may then declare himself the author; if it be suppressed, he may wonder in private without much vexation; and if it be censured, he may join in the cry, and lament the dulness of the writing generation.—*Dr. Johnson (Rambler, No. 56, September 29, 1750).*

RUSSIAN CATECHISM.—The Emperor Nicholas, father of the present Czar, caused a Catechism, from which the following extracts are made, to be printed and circulated throughout the empire, and taught in all the schools and churches professing the Greek faith throughout Russia:—

"Ques. What does our religion teach us, the humble subjects of his Majesty the Emperor of Russia, to practise towards him?"

"Ans. Worship, obedience, fidelity, the payment of taxes, love and prayer; the whole being comprised in the words, worship and fidelity."

"Ques. What kind of obedience do we owe him?"

"Ans. An active, passive, and unbounded obedience in every point of view."

"Ques. What benevolent sentiments are due to the Emperor?"

"Ans. We should manifest our goodwill and affection, in endeavouring to promote the prosperity of our native land, Russia (not Poland)."

"Ques. Is it incumbent on us to pray for the prosperity of the Emperor, and for Russia?"

"Ans. Both publicly and privately, beseeching the Almighty to grant the Emperor health, integrity, and security."

"Ques. How is infidelity to the Emperor to be considered in reference to God?"

"Ans. As the most heinous of all sins, the most frightful criminality."

"Ques. Are we called upon to respect the public authorities?"

"Ans. Yes; because they represent the Emperor; so that the Emperor is everywhere."

"Ques. What are the supernatural motives for worshipping the Emperor?"

"Ans. God commands us to love and obey, from the inmost recesses of the heart, every authority, and particularly the Emperor, from apprehensions of the final judgment."

UNIVERSITY REFORM.—Sir W. Hamilton, in his "Discussions," estimates the annual revenues of Oxford at about £600,000, and those of Cambridge at £200,000. The endowments of both universities were intended solely for educational purposes, but how are these now appropriated? Is it not notorious that more than two-thirds of the Fellows are non-resident? Even those who reside often do very little of the proper work of a Fellow. The tuition of the students is mostly carried on by private tutors or "coaches." In fact, the original objects of Fellowship endowments have long ago been lost sight of. What is the remedy for such abuses? Let all Fellows be required to reside and teach, or to resign their emoluments if they fail to do so. It might require an Act of Parliament to compel residence or resignation, but such an Act might be passed, I apprehend, without much difficulty in the next Parliament. What would be thought of an endowed school where the masters were paid £15,000 or £20,000 a year for educating from ten to thirty boys, and where less than one-third of the masters was in residence? Yet this is precisely the case of more than one college here.—A MEMBER OF THE SENATE OF THE UNIVERSITY OF CAMBRIDGE.

SEA—CAUTION.—Persons requiring berths for apprentices and boys in the merchant service are cautioned against replying to advertisements inserted by unauthorised persons styling themselves agents, captains, shipbrokers, shipowners, etc. An account of the persons recently convicted for unlawfully obtaining money, under the pretence of finding employment for boys and others on board ship, together with an official list of persons who can legally engage boys and others for merchant ships, may be obtained (gratis and post free), on application to the Registrar-General of Seamen, No. 6, Adelaide Place, London Bridge.

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—Cowper.

THE SALZBURG SHARPSHOOTERS BETRAYED.

THE EXILES OF SALZBURG.

CHAPTER XV.

IN the beginning of September, 1731, soon after these occurrences, the mountains of Salzburg reverberated with the roll of drums. Numerous bands of Austrian infantry overran the once peaceful country, whose amazed inhabitants, unconscious of the reason of their coming, distrusted the evidence of their own eyes. An imperial command to return to peace and tranquillity accompanied the quartering of thousands of soldiers, who, of course, were to be supported by Protestants

alone. The cottage of Hans Weinleidtner was not exempted from these unbidden guests. Deeply were the poor people disappointed in their expectations, for, instead of their deliverance, which they had hoped from the emperor, they saw their substance decreased by his soldiers.

Neither was Peter Pommer better off at Schüppelhof, which was now filled with a troop of ravenous soldiers.

"You also had better go there," he said to those whom he found sharing the frugal meal at the Weinleidtners' cottage. "It makes but little difference to me whether I have to feed five more or less."

The soldiers, highly pleased with the invitation, lost no time in availing themselves of it, and Peter remained alone with Hans. The next week he again came to the cottage, and brought with him a very handsome rifle.

"Take it, Hans," said he, good-humouredly. "Keep it in remembrance of me. But thou must promise to appear with me at the general muster of the sharp-shooters (*scharfschütze*) from all the mountains, which is fixed for next Monday.* I am as pleased about it as a child. We shall prove to the foreign soldiers, by our well-trained numbers, that we are not so very contemptible as they imagine, and that they cannot do with us exactly as they please."

Hans was a good marksman, and by no means devoid of national pride; he was, therefore, very willing to be present at the review spoken of. Early on the following Monday, Peter, holding in his hand a brightly-furbished gun, and with a high heel fixed to the shoe on his lame foot, the better to conceal a deformity which had never grieved him so much as on this occasion, came to fetch Hans, who was already attired in his best clothes. Both repaired to the place appointed, a large plain enclosed on all sides by low hills, where a regiment of imperial troops were already exercising. They, however, readily made way for the sharp-shooters of the mountains, whose numbers augmented every moment, noticing with apparent curiosity the great skill of the peasants in handling their firearms. The review commenced by a close examination of the sharp-shooters' rifle-pieces, powder-horns, etc., which were all to be empty, as they were found to be, in order to prevent, as was alleged, any accidents that might occur, and which otherwise might easily happen. Ambuscades were laid, and all those manoeuvres practised which are peculiar to this description of soldiery. Somewhat fatigued with their exertions, the various troops were standing at ease, when the colonel of the imperial regiment approached the leader of the sharp-shooters, who was an officer entirely devoted to the arch-bishop.

"Bravo! well done!" said he, in a loud voice. "Thou hast a capital corps of marksmen, whom I should rejoice to have acting with my troops in case of a serious assault. But stay! a thought occurs to me. Suppose that we were, though only in sport, to make an attack on each other, and be good comrades again at the end? We are the guests of the gallant fellows, and should consider this encounter as an honour."

"Very well," said the other, who was already prepared for the proposal. "I agree to it, provided that my comrades approve of the sport."

What human being was ever invulnerable to delicate flattery, skilfully administered? The true-hearted, credulous mountaineers, with unanimous acclamations, expressed their joyful assent to the proposed skirmish. It was arranged that the imperial troops should occupy the heights, and that the sharp-shooters, as being better acquainted with the road, should attempt to force a passage. The former soon disappeared, and the latter began descending a straight and rugged ravine, although some of them, who were not altogether unskilled in the art of war, shook their heads at the acquiescence of their leader. Too soon their fears were realised, for scarcely

had they all descended into the narrow valley when a loud "Halt!" echoed by a thousand voices, made them look upwards. On the summit of the rocks overhanging the narrow gorge, and as if sprung from the earth, they beheld the Austrians on all sides, standing with loaded muskets levelled at them.

"Ha! are ye caught?" shouted the colonel, exultingly. "Good people, surrender upon grace or no grace. You are surrounded on all sides, as you see."

"Thou must have employed an able spy," jocosely observed the leader of the mountaineers, "to betray to thee a road which is unknown to any but ourselves. Well, I find there is nothing now to be done but to beg for quarter."

"That ye shall have," returned the other, "provided ye lay down your guns, and give your solemn promise never again to fight against us."

"Agreed," said the leader of the riflemen, surrendering himself and his gun to the colonel, who had now advanced a little nearer. Turning to the mass of people who had hitherto looked upon these transactions with repressed laughter, "Well, what do ye mean to do?" said he, seriously. "Ye are to ground your arms, that is, throw them upon the ground, and then go home." The mountaineers, still believing it to be a joke, smiled in answer to this request, whilst some among them said they wished the jest now to be at an end.

"So it shall," cried the colonel, in a voice of thunder, "and the most decisive reality shall take its place. Ye are peasants, and therefore can have no pretext for firearms. If ye are in need of protection, we will extend it to ye. Once more; throw down your rifles, or ye shall every one of ye be shot."

The deathlike stillness which astonishment at this unexpected treatment had produced amongst the betrayed people, was now broken by the unanimous cries of "Ha! treason! revenge! down with the traitors!"

With a scornful laugh the colonel received this ebullition. "What are those marmots below murmuring at, in their trap?" cried he, insultingly, and then added: "Delay no longer; do ye suppose that we cannot make our threats good?" Then turning to his troops, he said, "Fire a dozen shots into that fir-tree in the midst of those fellows below; let them see that your guns are not loaded with swansdown." The sudden fire of muskets was followed by a thick shower of small branches and leaves, swept down by the bullets as they whistled through the tree, and falling upon the heads of the men below.

At this moment Hans felt somebody pulling at his sleeve. It was Peter, who said to him, in a voice stifled by rage: "Those fellows above have been reckoning without me. If my powder-horn and bullet-pouch are empty, so are not my pockets. Here," handing him a rifle cartridge—"take aim at the villain, our captain, and I will shoot down the swaggering colonel."

"Art thou mad?" replied Hans, suddenly pushing aside the weapon which Peter had already raised, and was preparing to take aim. "If we two were alone it might answer to do as you say; but now nine hundred of our faithful friends would have to pay for our deed by their lives—much too high a price for those wretches." Saying this he threw down his rifle. Peter gazed at his beloved gun in an agony of grief and vexation. His eyes glowed with rage, whilst hot tears fell upon the bright-polished barrel, and his were the last hands that parted from the often exercised weapon.

"They are an infamous gang of thieves!" he muttered between his teeth as he quitted the place of their

* The peasants of Salzburg were allowed the use of arms, and were therefore readily formed into a military force. It is recorded in the Chronicle of Salzburg, that in 1603, under the Archbishop Wolf Dietrich, they raised three standards against the Turks, and, under the command of Von Stadion, displayed great intrepidity at the siege of Stuhlweissenberg, which has alternately owned for its masters both Imperialists and Turks.—*Geographie von Salzburg*, p. 137.

shameful defeat, in company with Hans, all leaving their rifles behind them. "Was it not our own property that they took? I wish that thou hadst shot me rather than suffer this disgrace." And in a bitter rage he left Weinleidtner.

Having reached home, Peter went to his desk, and taking from it all his ready money, and a large parchment, covered with numerous seals, he mounted his horse and left his estate. It was well for him that his military guests had not returned from their morning's feat of heroism.

"As thou camest to me, so do I part from thee," said he, smiling, as at the gate he cast a farewell look at the Schüppelhof. Soon afterwards he made a hurried visit to Weinleidtner's cottage. "Hans," said he, drawing him aside, "I am going to the good King of Prussia. The Schüppelhof was not made for me, nor I for it; I have therefore given it to Barbara and her brothers. Here is the deed of gift, which I had privately prepared, and had it legally confirmed long ago. The present time is the best to put you in possession of it. Ask me no questions. Do not detain me. The knife is at my throat, and the clergy at my heels. I should not like to count the steps that lead down to the dungeons in Castle Werffen. Thou wilt know soon enough what has happened." Thus saying, he shook them all by the hand, bade them a hasty farewell, and departed.

CHAPTER XVI.

A SEQUESTRATION was laid upon the Schüppelhof, and the soldiers quartered there were immediately withdrawn. Such of them as had formerly lodged in Manlicken's cottage, now again occupied it, thereby occasioning the greatest inconvenience to the family. Nevertheless, Hans, guided by sound discretion, forbore to assert his claim to the Schüppelhof, because then the estate would have been completely dissipated by new and oppressive burdens, and an immoderate quartering of soldiers. He therefore thought it best to wait for peaceful times. Meanwhile, the imperial cavalry, consisting of the dragoon regiments under the command of the Princes Eugene and Staremburg, together with the cuirassiers of Prince Philip of Wurtemberg, advanced into the little mountainous district, so that the total number of foreign soldiers amounted to six thousand. Among the dragoons of Prince Eugene, there were many Protestants, who, instead of annoying the Salzburger, rendered them every possible assistance, prayed with them, read the Bible to them, and encouraged them to adhere steadfastly to their faith. This, however, was no sooner discovered, than they were withdrawn and replaced by others, who delighted in placing every obstacle in their way to prevent the exercise of their religion.

Encouraged by the support of so large a body of imperialists, the archbishop now thought that he might safely bid defiance to the multitude of Protestants, and therefore threw off the mask of seeming indulgence towards them. An archiepiscopal edict was issued on the 31st October, 1731, the anniversary of the Reformation, threatening the Protestants with an irrevocable expulsion. By the peace of Westphalia all emigrants on account of their religion were allowed the space of three years to arrange their affairs; but the archbishop in this instance granted to those who were not proprietors of land, only fourteen days from the date of the publication of the edict, to the period at which they were to leave the country; to landowners whose possessions were under the value of one hundred and fifty florins, one month was given, and above that and under five hundred florins, two

months; to those who had more than five hundred florins in immovable property, such as fields, grounds, and tenements, he allowed the space of three months to settle their pecuniary affairs. At the same time they were prohibited to sell their cattle, either in foreign countries or to foreigners. The same interdict was placed on their landed property. In consequence of these orders, the Salzburger were compelled to dispose of their possessions at nearly nominal prices; this indeed was the object that the advisers of the misguided archbishop had in view, and by which they expected to fill their pockets at the expense of the unfortunate sufferers. The latter, moreover, were obliged to pay into the treasury a part of the money obtained by the sale of their effects, by way of fine for having rebelled against their prince. Those who referred to the articles of the peace of Westphalia, were answered that they did not relate to unmarried persons, day-labourers, and non-proprietors, and that the archbishopric of Salzburg in particular was not comprehended in that treaty. The Protestant workmen in the salt works, smelting-houses, foundries, timber-drifts, and similar establishments, were forthwith discharged; and the possessors of the largest farms were only allowed to have one man, and one woman servant, up to the time of their expulsion. The Protestants were not permitted to attend divine service, and their artisans and other tradespeople were compelled to abandon their avocations, and in the mean time the Catholics were allowed to profit by them. No oppression, however, could overcome the constancy of these poor people. They still relied with great confidence on the protection of the Protestant sovereigns, who through their ambassadors transmitted energetic remonstrances to the archbishop. Even the Emperor Charles VI publicly condemned what he termed the inhumanity and barbarity of Leopold Von Firmian; but all remonstrance was ineffectual to procure more than the space of two months longer to the landowners.

The King of Prussia was the first German prince who, soon after these events, strenuously interfered in behalf of the oppressed. He declared the exiles to be his subjects, and threatened to indemnify them for their losses by giving them the property possessed by the Catholics in the bishoprics of Magdeburg, Hulberstadt, and Ravensburg. A similar reparation was menaced by the Danish minister, Von Holtze, in the name of his sovereign. Holland, however, was the first to make reprisals on the Catholics, by closing several of their churches. These steps in their favour were not quite unknown to the Salzburger, although on all the frontiers spies were stationed, and all letters were intercepted. They therefore deemed their expulsion an improbable event, and, devoid of anxiety, continued daily to follow their wonted employment.

THE GOLD-FIELDS AND DIAMOND-BEDS OF SOUTH AFRICA.

BY T. BAINES, F.R.G.S.

THE existence of gold-fields in South Africa is no new discovery. Vasco di Gama, after rounding the Cape of Good Hope, reached the Zambesi, or river of good signs,* in 1498. In 1502, he visited Sofala, and among the productions of the country gold was heard of specially. In 1569, three ships, with a thousand men,

* He found at Mozambique large vessels with sails of palm-leaf matting, but without decks, manned by Arabs, who not only traded along the coast, as had been their practice from early times, but, being acquainted with the use of the compass, extended their voyage to India.

mostly volunteers of rank, sailed from Lisbon to take possession of the gold-mines of Monomotapa, to the westward of Tette, on the Zambesi, and those of Manica, more to the south-west. They were abundantly supplied with horses, asses, camels, and provisions. At Senna, on that river, they found many Arab and other traders, who offered much resistance to their progress. Their horses died, probably from the bite of the Tsetse fly, though they suspected the Arabs of poisoning them. Barreto, the leader, continued his march with five hundred and sixty men, but they suffered so terribly from hunger and thirst, and the assaults of the natives, that he failed to reach the gold-fields.

When the Portuguese settled on the Zambesi, the washing of soil for gold dust became a recognised branch of industry, which was carried on at various points, north, south, west, and south-east of Tette. A merchant with his slaves carrying goods would proceed to the selected spot, and making a present to the chief, would obtain liberty to commence work. His slaves were told off into gangs, each of which had a confidential head man to oversee their work, and also to purchase gold dust for his master, and grain for the support of the party from the natives. And in this manner about 130 pounds of gold or more per annum were obtained; but when the slave trade offered a more lucrative mode of disposing of the native labour the washings were almost abandoned, and the supply of gold fell to eight or ten pounds yearly.

Dr. Livingstone, in passing from Linyanti to Tette in 1856-7, noticed among the hills between the Kafue and Loangwa, to the west of Zumbo, on the Zambesi, a strongly-marked depression, evidently waterworn, as if the current had been deflected northward toward the Maravi country, north of Tette. In this lay many of the principal gold-washings. Dr. Livingstone, during his stay in Tette in 1856-7, examined what were formerly the gold-washings of the rivulet Mokoroze, ten or twenty miles north, in the sixteenth degree of south latitude, where the banks were still covered with fine mangotrees, planted by the Portuguese who engaged in the work. The sand was put into a wooden bowl with water, and washed with a half rotatory motion, which caused the coarser particles of sand to collect on one side: they were removed by hand, and the process continued till only the gold remained.

There were also six well-known washing-places, east and north-east of Tette—Mashinga, Shindundo, Missala, Kapata, Mäno, and Jäwa, gold being found both in clay thole and quartz. At the range Mushinga, to the N.N.W., the rock was so soft that the women pounded it in wooden mortars previous to washing. Round to the west, the Portuguese spoke of a rich station, called Dambarari, on the river Panyamé, near Zumbo. Farther west was the now unknown kingdom of Atütua, famous for its gold; and then, coming round toward the south and east, were the gold-washings of the Mashona, or Bazizulu. And still more east the yet richer district of Manica, the supposed Ophir, the gold dust of which seen by the doctor was as large as grains of wheat. A pair of compasses with one leg placed at Tette, and the other extended to three and a half degrees, brought round from the north-east of Tette, to west, to south, and to south-east, would touch most of the gold country, the richest parts being nearest the circumference, while a valuable coal-field near, almost on the fertile banks of the Zambesi, lies in its centre.

Major Secard, the kind-hearted commandant of Tette, presented Dr. Livingstone with a golden rosary, the work of an instructed native, and specimens of native

gold and coal, which are now in the Geological Museum at Jermyn Street, London. When I was myself on the Zambesi, in 1858, I saw several of the slaves, or rather serfs, of Major Secard, working very cleverly in native gold. A pan of charcoal, a few crucibles of various sizes, a couple of feet of a musket barrel for a blowpipe, a plate of steel or iron pierced with holes for wire-drawing, and a few rough-looking hammers, pincers, etc., composed the apparatus with which, squatting on the ground under the shelter of a rude straw hut, they turned out really very creditable specimens of rings, chains, crosses, and other ornaments. And a Portuguese gentleman of whom, by Dr. Livingstone's desire, I had painted a portrait, presented me with an exceedingly neat watch-guard of fine wire, worked up exactly in the manner of the Trichinopoly chain. This, as a specimen of native material and work, I valued very highly, but it was unfortunately stolen from the officer who kindly undertook to convey it to England for me.

I may also mention that in 1849, when I was in the country of the Dutch African emigrants, north of the Vaal River—now the Trans Vaal, or South African Republic—I frequently heard of native chiefs to the north, in whose country gold was found in considerable quantities. I do not remember at this moment that I actually saw any specimens; and it would have been imprudent to evince much curiosity on the subject, as the Boers did not engage in search for it, and rather wished to keep its existence a secret, lest English adventurers should be tempted into their adopted country, and they themselves again be brought into subjection to the British Government. Nevertheless, with the aid of my friend and fellow-traveller, Joseph Macabe, I constructed a map of the Trans Vaal country and the Limpopo River, so far as he had explored it; and this, incorporated by Mr. H. Hall in his map of South Africa, approximated so nearly to correctness, that though additions have been made, no alteration that I am aware of has been yet found necessary. I mention this chiefly because it is in the country bounded by the Limpopo on the south and the Zambesi on the north, that the gold-fields which our countrymen are now successfully working out are situated; and before relating the circumstances that have led to their occupation, I will so far trespass on the patience of the reader as to quote from the annual address of Sir Roderick Impey Murchison, the president of the Royal Geographical Society, a few remarks bearing on this subject:—

"The colony of Natal seems destined to rise to considerable importance if the coal—which is plentiful in its north-western parts—should be rendered useful by the construction of railroads to convey it to Pieter-Maritzburg and Durban. I have reason to think this coal is of palæozoic times, and of the best quality. I have recommended her Majesty's Government to send out a mining engineer to report upon it, for the capability of supplying our steamships with fuel on the coast of Africa would be an immense advantage. The colony has also been much excited by the discovery of gold in and near Moselekatse's country, to the north-west of the Trans Vaal territory, and hitherto noted chiefly for its ivory and ostrich feathers.

"M. Carl Mauch, a young German geologist, leaving Trieste in 1863, has been travelling in South Africa since 1865, and becoming acquainted with Mr. Hartley, an elephant hunter, who has traversed all the highlands which form the broad-backed watershed between the Zambesi on the north and the Limpopo on the south, and who informed him of the existence in these high and rocky lands of the relics of ancient metalliferous excavations, M. Carl

Mauch explored them in two localities, one in south latitude $20^{\circ} 40'$, on an affluent of the Limpopo, and the other on an affluent of the Zambesi, about forty miles south of Tette. He discovered rich auriferous white quartz rocks, embayed in a variety of ancient crystalline rocks, whether hard slates (probably Silurian) or various igneous rocks, including a great predominance of granite and diorite. The loftiest part of this elevated tract being 7,000 feet above the sea, in south latitude $19^{\circ} 50'$, and east longitude $28^{\circ} 35'$, presents in parts great accumulations of these broken masses of granite, to which my illustrious friend, the late Leopold von Buch, assigned the appropriate name of Felsen Meer, or a sea of rocks. Many travellers have considered these to be boulders, whereas they are, in fact, the results of decomposition *in situ* as seen in many granite countries.

"The auriferous quartz rock which, in places, is still seen to rise a few feet above the surface, has, where rich in gold, been quarried down in open trenches to the depth of six feet or more. The works seem to have been abandoned from the influx of water, and in one spot remains of smelting operations, with slag scorice and relics of lead ore, were observed.

"Of the auriferous territories, the northernmost, on a tributary of the Zambesi, is the most sterile, and this explains why the Portuguese never made much of it, only small quantities being washed down by the rivers south of Tette.

"On the other hand, the rich tract on the river Thuti or Tuti, an affluent of the Limpopo, and the proof of ancient works there, favours the suggestion I offer, that the Ophir of Solomon was near the mouth of that great stream. The tract is precisely where, as a geologist, I should have expected to find gold, *i.e.*, in the elevated ancient slaty quartzose rocks (probably Silurian), with granite and greenstone, which form the mountains in south latitude 21° , that form the watershed of some of the tributaries of the Zambesi and Limpopo.

"This discovery leads me to consider the suggestion made two years ago by Mr. George Thompson, that the Ophir of Solomon might, after all, have been on the country of the Limpopo—in support of which he quoted the current reports of the existence on that stream of the ruins of an ancient city. It was this belief that led the Portuguese to send expeditions to south-east Africa, where the relics of churches built by the Jesuit fathers may still be traced; but they were not successful, having failed to search far enough south from the Zambesi.

"It was at one time thought that Ophir was in Arabia; but this is not likely, as from the structure of the country the traders from Tarshish could find no gold on the shores of the Red Sea. The African rivers north of the equator bring down no gold dust, neither is the country between Zanzibar and the Zambesi auriferous. It is only on reaching to the south that auriferous rocks occur in the interior, from which the waters flow to the Zambesi on the north, but chiefly to the Limpopo on the south. I venture therefore to say that this was in all probability the source which supplied the ancient Ophir. It was rich in ivory; and if Hebrew scholars think that the Biblical writers might not clearly distinguish between the feathers of the peacock and the ostrich, another difficulty vanishes. It is also rich in ebony, and these may have been the almug-trees of which Solomon made pillars for the house of the Lord—sandal-wood, as suggested by the late Mr. Crawford, being too small for that purpose."

With regard to the discovery of the gold-fields, I can only say briefly that I have long known of Mr. Hartley

as a most enterprising trader and elephant hunter, and I can well believe a story which I have recently heard of him, as being characteristic, not only of himself, but as showing the sort of man needed to make his way among, and win the confidence of, the wild tribes of the interior. Hartley, with some other hunters, mostly Dutch, had made his way to the residence of the despotic chieftain Moselekatse, who, not content with the presents they had selected for him, determined to possess himself of everything, even to their cattle, their waggons, and their guns. The rest submitted to be robbed, but Hartley stoutly refused; he had given all he could spare, but he could not shoot elephants without his gun, and he would not part with it. The chief felt a sentiment of respect for a man with spirit enough to dispute his will, and lent Hartley the waggon he had just accepted from him, upon his promise to return it after he had collected his ivory and carried it to Natal. Of course Hartley kept his word. He bought new waggons with the proceeds of the ivory, returned the original waggon to Moselekatse, and became the privileged hunter in the tyrant's domains.

Hartley informed Carl Mauch of the existence in those rocky highlands of the relics of ancient metalliferous excavations, and the ardent young geologist accompanying him explored the localities; and though the suspicions of the natives, aroused by his strange and to them inexplicable proceedings, checked him considerably, he obtained and sent home specimens sufficient to establish beyond a doubt the richness of the veins. Some of these, in small grains, embedded in quartz, and others in alluvial soil, were shown us at the rooms of the Royal Geographical Society, by J. J. Pratt, Esq., the consul for the South African Republic.

The Cape papers of April 16th contain the record of the starting of the first party of gold diggers, under the leadership of Mr. Hartley and Captain Black; and from others of July 16th and later dates, we learn that they are working with every prospect of success, not less than sixty or seventy men being at work between the Tatin and the Ramakhoban. They had left off washing in the alluvial ground; but, attracted by the richness of the gold veins in the surface quartz, had commenced blasting the reefs, the vein growing richer as they advanced, being sometimes more than an inch broad, and small pieces of quartz containing from £1 to £3 worth of pure gold. One specimen received at Port Elizabeth was valued at the rate of £12,000 per ton.

The public at home will be glad to learn that the gold-diggers are at present on good terms with the native chief, Matjen, whose independence it appears has been acknowledged by Moselekatse. They are paying the chief £1 per man for six months' licence to dig, and one of the Europeans is acting as his agent to collect his dues; and, of course, they have to purchase from him or his people such grain or other provisions as the country affords, and to hire natives as servants or assistants in various capacities. But Matjen has sense enough to perceive that complications may arise, and that he is not competent to the task of governing an already large and still increasing community of Europeans; and therefore, with the concurrence of his missionary, he has written to the governor of Cape Colony, requesting him to take measures for the government of his own people. I sincerely trust that such equitable measures will be taken, as while they secure to our countrymen the due reward of their own labour, will also guarantee the chief against any loss of dignity among his own people, and will make the contact with industrious Englishmen a benefit and a blessing to the natives.

I find I have left myself but little room to speak of the other source of wealth, the finding of diamonds on the borders of the Cape Colony. The Orange River has long been looked on as a probable place in which to search for jewels; but remote farmers are not generally competent judges of the value of the stones picked up, and some, which were valuable diamonds, were lost through carelessness, while one was smashed to fragments upon an anvil, because a diamond was supposed to be the *hardest* of all known substances, whereas, in reality, it is also nearly the most brittle, and it would be dangerous to let a valuable diamond fall upon the floor. At length one was sent down to my friend Dr. Atherstone, in Grahamstown, and he decided on forwarding it to the Cape, whence, after being valued, it was sent to the Paris Exhibition. Much anxiety was manifested by the finders of this and subsequent jewels, as to the right of the Crown to all minerals and precious stones; but the governor, Sir Philip Wodehouse, very properly and liberally took upon himself to waive that right for the present, thus giving the finders the full advantage of their good fortune.

I believe six well-authenticated diamonds have been found, one of them by a Hottentot, near the missionary station of Pnail, about the junction of the Vaal and Orange Rivers. He showed it to his missionary, who sent it to Dr. Atherstone. He pronounced it a diamond of great value, worth perhaps £500 or more, and received instructions to send it to the care of the colonial secretary in Cape Town, to be held or disposed of for the benefit of the finder. I have just seen two of the diamonds, which have been bought by Sir P. Wodehouse and are in the possession of Messrs. Garrard, jewellers to her Majesty, in the Haymarket. One weighs $21\frac{1}{2}$ carats, and the other $8\frac{1}{2}$ carats. The smaller one would be worth £200. The other, if placed on a half-sovereign, would not project over its rim, but is a trifle heavier, and a thousand times more valuable, than that coin. The fact of six or seven such diamonds having been found almost in one locality, in so limited a time, is remarkable, Brazil producing one of such value only in about twelve months. And Mr. Tennant directs the attention of searchers to small stones and dust which are worth £50 per ounce, pointing out that if diamond dust could be gathered in such abundance as to reduce its price to £5 per oz., many substances which cannot now be profitably worked would become useful.

THE MIDNIGHT SKY AT LONDON.

DECEMBER.

BY EDWIN DUNEIN, F.R.A.S., ROYAL OBSERVATORY.

The midnight sky is perhaps more brilliant in December than in any other month of the year at the same hour. Some of the finest constellations which adorn the heavens south of the zenith are now in conspicuous positions. Among these, Aries and Taurus, west of the meridian, Auriga, Orion, and Canis Major, almost due south, or on the meridian, and Canis Minor, Gemini, and Leo, in the east, may be specially mentioned. Adding to the above the circumpolar constellations north of the zenith, Ursa Major, Ursa Minor, Draco, Cassiopeia, and others, we have at one view the majority of the principal stars visible in the northern hemisphere. Any one stationed so as to command the whole of the sky above the horizon, can at this time perceive the following first-class stars:—Aldebaran, Betelgeuse, Rigel, Delta, Epsilon, and Zeta Orionis (the three stars in the belt of Orion), Capella, Sirius, Procyon, Castor,

Pollux, Regulus, Denebola, Alpherat, Vega, Deneb, and the stars composing the well-known groups of Ursa Major, Perseus, and Cassiopeia.

Beginning as usual with the south-western quarter of the sky, or the right-hand side of the lower diagram, the observer is requested to look overhead, when he will notice a very bright star, Capella, about eight degrees from the zenith. Due west of Capella, the Perseus group can be distinguished in the Milky Way; its principal star, Alpha Persei, will be found inserted in the upper diagram, while Algol is in the lower, the imaginary line separating the two views passing between these stars. Alpha and Beta Arietis, the chief stars in Aries, are below Perseus towards the west; they can be identified in the diagram near the right-hand upper corner. Between Aries and the western horizon, the space is wholly occupied by Pisces. Taking Capella as a zero-point, and looking towards the south-west, we pass over the thickly-studded constellation Taurus, the position of which is easily recognised by the Pleiades group, and by Aldebaran, with its companion stars the Hyades. Below Taurus and Aries, in this direction, Eridanus and Cetus extend to the horizon. The stars immediately below Aries belong to Cetus, and those near the south-west horizon to Eridanus.

From the zenith to the horizon, along the plane of the meridian, we pass over Auriga, which now occupies the sky directly overhead. Its principal stars, Capella and Beta Aurigæ, are near the zenith, the latter being on the meridian. Below Auriga, the two signs of the zodiac Taurus and Gemini join each other, and beneath these the brilliant assemblage of stars composing the Orion group is at its greatest elevation. Directly below Orion, the small constellation Lepus can be identified by some moderately bright stars; and south of Lepus, very near to the horizon, a few stars in Columba can be seen on clear nights when the south horizon is free from haze. The bright star about half-way between the zenith and the upper stars in the quadrilateral of Orion is Beta Tauri, or Nath, the second star in Taurus. We have given on another page a separate diagram of Orion on a larger scale than that adopted in the sky views, and have also inserted the names of all the principal stars in that favourite constellation. For this reason it will be sufficient, therefore, to state here that the north-western star of the quadrilateral is Bellatrix, or Gamma Orionis; that in the north-east is Betelgeuse, or Alpha Orionis; that in the south-west corner is Rigel, or Beta Orionis; and that in the south-east is Kappa Orionis. The most westerly of the three stars in the belt is Mintaka, or Delta Orionis; the central one is Alnilam, or Epsilon Orionis; and the most easterly star is Zeta Orionis, or Alnitak.

Some very prominent stars are contained in the south-eastern quarter of the sky, but still a considerable portion of this division of the heavens is comparatively bare, especially east of Orion and Canis Major. Sirius, the most conspicuous of all the fixed stars, and several other objects in Canis Major, are now visible in the S.E.; some of them are, however, near the horizon. At some distance east of Betelgeuse, after passing across the Milky Way, Procyon can be detected as much from its intrinsic lustre, as by its forming, with Betelgeuse and Sirius, the most splendid stellar equilateral triangle in the heavens. North of Procyon, the twin stars Castor and Pollux can be recognised at a glance. The tolerably bright objects between Pollux and Orion all belong to Gemini. Looking due east all the stars in Leo are distinctly visible; many of them are, however, very near the eastern horizon. In the left-

hand upper corner of the lower diagram, Regulus, Gamma Leonis, and the remaining stars in the Sickle are inserted, but the other stars in Leo are outside the limit of the diagram. Although the absence of large stars in the south-east makes that part of the heavens look, by mere contrast, almost bare, yet one scarcely notices the defect on the clearest winter's night, on account of the unusual brilliancy of the meridian sky. Excepting Alpha Hydræ, or Alphard, there is scarcely an object between Canis Minor and the horizon above the fourth magnitude. Alpha Hydræ can be detected in this thinly-studded region of the heavens, by this total absence of any star of equal magnitude. The constellations Monoceros, between Orion and Canis Minor, Sextans, below Leo, and Cancer, between Gemini and Leo, contain no star of sufficient prominence for a special indication of its position. The planets Mars and Jupiter are both visible in December, at midnight, but they are in exactly opposite quarters of the sky. Jupiter is a few degrees above the horizon in the west, and within a short time of setting. He has, however, been the most conspicuous object in the south-western sky during the evening hours. Mars is in Leo, a little south of east, a few degrees below Regulus.

North of the zenith, the midnight sky contains portions of several well-known constellations, which at the same hour in other seasons of the year are included in the south sky. Many of them are, however, near the horizon. Beginning at the west, and passing round the horizon from west to north and east, some of the principal stars in Pegasus, Cygnus, and Lyra, can be seen very low down on the western side of the meridian, and those in Hercules, Boötes, Coma Berenices, and Virgo, on the eastern side. The horizon due west and east is occupied by Pisces and Virgo respectively. Nearly the whole of Andromeda has passed from the lower to the upper diagram since last month. Polaris is very easily identified, as it is the most important star between the zenith and the pole. This district of the heavens is entirely occupied by Camelopardus. The meridian between Ursa Minor and the north horizon passes through the widest portion of Draco, whose two brightest stars, Beta and Gamma, are at about twelve degrees altitude, Beta having just passed the lower meridian, to which Gamma is approaching. These two stars indicate the position of the head of the Dragon.

In the north-western sky, the chief stars in Cassiopeia, Cepheus, and Andromeda, can all be readily traced. Cassiopeia is very favourably situated in the north-west, midway between the zenith and horizon. The apparently lowest object of this group is Beta Cassiopeiæ, the leading star of the constellation. In the W.N.W., or in the upper part of the diagram on the left hand, the stars all belong to Perseus or Andromeda. It has been already mentioned that one half of Perseus is contained in the upper, and the other half in the lower diagram, thus separating the two principal stars in this asterism. Below Perseus, towards the west, the first tolerably-bright star is Gamma Andromedæ, the next Mirach, or Beta Andromedæ, and that near the limit of the diagram Alpherat. All these stars can be recognised in the heavens, in the order we have given, by looking a little south of west. Cepheus is north of Cassiopeia, and north-west of Polaris, and in the same direction, near the horizon, Deneb, or Alpha Cygni, is the brightest star now visible in this quarter of the sky. Vega is above the horizon, but only by two-thirds of a degree. The haze is, however, always dense enough to obscure it. This star has been observed occasionally in former years, when in this position, by the Greenwich meridian

instruments; but since the growth of London in the north-eastern suburbs, the increased impurity of the atmosphere has prevented any observations being made.

Ursa Major is the principal constellation in the north-eastern quarter of the sky. Its position can be perceived by its seven chief stars. It extends to within twenty degrees of the zenith. Dubhe and Merak, the Pointers, are now the uppermost of the stars in Charles's Wain. This group is approaching that part of the sky in which they were situated in our first diagram in January. By an inspection of the twelve diagrams of the north sky, the effect of the seasonal changes, independently of the daily variations owing to the diurnal rotation of the earth, can be easily followed by noticing the monthly positions of this well-known group. Every day in the year these stars, in common with all the others, have apparently revolved in a circle, of which the celestial pole is the centre. They have also, as we explained in March, revolved around the pole once during the year, as a consequence of the revolution of our globe in its orbit around the sun in the same time. They have, in fact, revolved 366 times in 365 days. All the circumpolar constellations would serve as examples of the seasonal variations of the positions of the stars, for any given hour, as well as Ursa Major, but the well-defined form of this group makes it more easily recognised than any other. If we except Ursa Major, there are not many bright stars in December in the north-eastern midnight sky. Kocab, and Gamma Ursæ Minoris, to the left of Charles's Wain, and Cor Caroli to the right, are the principal objects after the seven in Ursa Major. A close pair of stars near the upper part of the diagram are Iota and Kappa Ursæ Majoris, situated in the Bear's fore-foot, and a similar pair a little lower, but more to the right, are Lambda and Mu Ursæ Majoris, in the right hindfoot. These two pairs of stars are very clearly seen in the heavens.

Auriga, the Charioteer, one of the ancient asterisms, is generally represented on celestial maps holding a goat and two kids in his left hand. By the Arabs he was termed the Guardian of the Pleiades. According to the ancient mythology he was placed, after his death, among the stars, on account of his invention of chariots, and for his skill in the management of horses. The goat and the kids were supposed to have been given a place in the heavens in honour of Amalthœa, a daughter of Melissus, King of Crete, who, with her sister Melissa, fed Jupiter with goats' milk during his infancy. It has also been suggested that Auriga was a scientific representation of the fable handed down to us of Phaëton. Two small stars in the kids, Zeta and Eta Aurigæ, named the Hædi, were regarded in days of yore as having an unfavourable influence on the weather. Callimachus says in an epigram of the Anthologia,—

"Tempt not the winds, forewarned of dangers nigh,
When the kids glitter in the western sky."

Capella, the principal star in this constellation, is situated on the body of the goat, or rather on the left or western shoulder of the Charioteer. At midnight in December it is only a few degrees from the zenith, where it shines with great brilliancy. In summer, at midnight, it is a conspicuous object near the north meridian, at an altitude of about seven or eight degrees, and is consequently always above the horizon of London. Capella is slightly east of the Milky Way, and occupies the summit of a triangle, the base of which is formed by uniting Alpha Cassiopeiæ and Polaris. The nearest three small stars inserted in the diagram south-west of Capella mark the position of the kids. Beta Aurigæ,

the second star in this constellation, is on Auriga's right shoulder, and is now on the meridian about six degrees from the zenith. Auriga is bounded on the north by Camelopardus, on the east by Lynx and Gemini, on the south by Taurus, and on the west by Perseus. In the catalogues of the ancients, the positions of about fourteen stars were registered. Hevelius, in the seventeenth century, included forty in his "Uranographia," Flammsteed sixty-six in his "Historia Celestis," while Bode,

INDEX-MAP, LOOKING NORTH, DECEMBER 15.

by collecting together a smaller class of stars, has inserted two hundred and thirty-nine in his atlas. The stars in this constellation are very easily found by alignment, especially as Capella is such a brilliant isolated object. A long line drawn southward perpendicularly to the Ursa Major Pointers will lead to Auriga. But if we look in an upward direction from Orion, we may profitably take the rhymers' advice, Nath being Beta Tauri on the tip of one of the horns of Taurus.

"From Rigel rise, and lead a line through Bellatrix's light,
Pass Nath, upon the Bull's north horn, and gain Capella's height—
Where a large triangle is form'd, isosceles it seems,
When Beta is with Delta join'd to lustrous Alpha's beams."

Camelopardus is a modern constellation introduced into the heavens by Hevelius. It contains no star above the fourth magnitude, although it occupies nearly

INDEX-MAP, LOOKING SOUTH, DECEMBER 15.

all the space between Auriga and Ursa Minor. Camelopardus has Ursa Major and Lynx on the east, Perseus and Auriga on the south, Perseus and Cassiopeia on the west, and Cepheus, Draco, and Ursa Minor

on the north. Lynx is also one of the introductions of Hevelius from the outlying districts not constellated by the ancients. Like Camelopardus, Lynx contains no star greater than the fourth magnitude. It is inclosed by Ursa Major, Camelopardus, Leo Minor, Cancer, Gemini, and Auriga. Leo Minor is another constellation in this neighbourhood with no conspicuous star. It is situated between Leo and Ursa Major.

Lepus, the Hare, is a small constellation due south of Orion, and one of those known to the ancients. Four small stars just below Rigel point out the position of the two ears of the animal. South of these four stars, three others of the third magnitude belong to Lepus. Columba Noachi, or Noah's Dove, is very near the horizon below Lepus. Its principal star is of the second magnitude. Columba is a modern introduction among the constellations.

Although Fluvius Eridanus is an immense asterism, extending from Orion in the east to Cetus in the west, and to a point considerably below the horizon of London, it contains very few prominent stars visible in these latitudes. Achernar, the principal object in Eridanus, is, however, a very brilliant member of the southern skies. Beta Eridani is situated very near Rigel in the direction of the Hyades. Monoceros, east of Orion, contains no object worthy of special notice, excepting that the Milky Way passes through it. The four constellations, Lepus, Columba, Eridanus, and Monoceros, all of which are not very distant from the brilliant Orion, need no further description.

The course of the Via Lactea, or Milky Way, is generally laid down with great precision in all celestial maps, but the reader will be able to gather some idea of its position, with respect to the stars, by the series of diagrams which illustrate these papers. This very remarkable nebulousity extends over a vast portion of the celestial sphere, diverging, at a certain point, into two branches, which afterwards reunite. To the eye it has the general appearance of a diffused milky light, but of variable intensity. When viewed, however, with a very powerful telescope, it is seen to consist of innumerable stars, so crowded together at such immense distances from us that their combined light only produces to the naked eye that nebulous appearance by which it is distinguished. The Milky Way is inclined to the celestial equator about sixty-three degrees, which it intersects in the constellations Monoceros and Aquila. Its breadth is very irregular, in some parts being only three or four degrees wide, while in others it spreads over from twelve to sixteen degrees. Confining ourselves to that part of the Via Lactea situated above the horizon of London, we find it in the constellation Scorpio, from which it traverses in succession, Aquila, Vulpecula, Cygnus, Cassiopeia, Perseus, Auriga, between the feet of Gemini and the horns of Taurus, and then over the club of Orion to Monoceros and Canis Major. From the earliest ages it has maintained the same relative position with respect to the stars.

The multitude of minute stars seen in the Milky Way through such instruments as Sir William Herschel's forty-foot reflecting telescope, or with the still greater reflector of the Earl of Rosse, is one of the most marvellous exhibitions of stellar glory with which we are acquainted. On such occasions the stars are scattered over the field of view like glittering dust on the dark ground of the sky. From this we can clearly understand that the poet Milton was not writing pure imaginative thoughts when he explained this celestial girdle as—

W

E

THE MIDNIGHT SKY AT LONDON, LOOKING NORTH, DECEMBER 15.

E

W

THE MIDNIGHT SKY AT LONDON, LOOKING SOUTH, DECEMBER 15.

"A broad and ample road, whose dust is gold
And pavement stars, as stars to thee appear,
Seen in the galaxy, that milky way,
Which nightly, as a circling zone, thou seest
Powder'd with stars."

The variability of the light of the Milky Way can be perceived in a moment on any clear moonless night, when favourably situated. The most brilliant part of the northern half is that which passes through Aquila and Cygnus; but this is exceeded in the southern hemisphere, where the magnificence of the Via Lactea is considerably heightened by the proximity of a large number of very conspicuous stars, including those in Scorpio, Centaurus, Crux, or the Southern Cross, and others. Humboldt noticed that if in some large portions of the Milky Way the light is uniformly distributed, there comes immediately afterwards other regions where the most brilliant parts alternate with others comparatively free from stars, giving the appearance of an irregular luminous celestial network. In certain portions of this remarkable nebulosity, perfectly obscure places are found in which it is impossible to discover a single object, even down to the eighteenth or twentieth magnitude. For example, Sir John Herschel has remarked, that in the midst of a brilliant part of the Milky Way, near the Southern Cross, "surrounded by it on all sides, and occupying about half its breadth, occurs a singular dark, pear-shaped vacancy, so conspicuous and remarkable as to attract the notice of the most superficial gazer, and to have acquired among the early southern navigators the uncouth but expressive appellation of the *coal-sack*. In this vacancy, which is about eight degrees in length and five degrees broad, only one very small star visible to the naked eye occurs, though it is far from devoid of telescopic stars, so that its striking blackness is simply due to the effect of contrast with the brilliant ground with which it is on all sides surrounded."

In a former paper we have alluded to the greatest number of stars visible to the unassisted eye at any one time being no greater than two thousand, including every star down to the sixth magnitude above the horizon; but if we were to count the same number of stars in the Milky Way we should discover that they would be contained in a very small square space of this luminous stratum. For instance, Sir William Herschel found that in a part of the galaxy where the stars were most thinly scattered, eighty objects were, on an average, included at once in the field of view of his great telescope. Without moving his instrument, and simply allowing the stars to pass across the field by the diurnal rotation of the earth, he found that in the course of an hour 4,800 minute stars had passed before his eye. But when the telescope was presented to a rich portion of the Milky Way, he found no less than 588 stars, and during fifteen consecutive minutes no apparent diminution in their numbers could be perceived, one constant stream of objects entering and leaving the field of the telescope in the interval. Sir William Herschel estimated that at least 116,000 stars must have passed in review before him in that short space of time. Such immense numbers are therefore contained in a narrow zone of this wonderful assemblage of stars. Most of those interesting objects termed stellar clusters are situated in or near the Via Lactea, for Herschel found that 225 are within its boundaries, while only thirty-eight had been observed in other parts of the heavens. As the Milky Way only occupies about one-twelfth part of the celestial vault, and one-ninth of that visible in this country, it has been computed that stellar clusters are fifty-four times more abundant in the Via Lactea than in other portions of the sky.

Sir William Herschel found that this stellar stratum was almost fathomless, even with his great forty-foot reflecting telescope. More recent powerful instruments have, however, revealed multitudes of stars which appeared to him only as nebulous objects, and it is very probable that future improvements in the construction of astronomical telescopes will enable the observer to penetrate still farther into these realms of space. Estimating the thickness of the Milky Way by its apparent breadth, Sir William Herschel deduced that it is about eighty times the distance of stars of the first magnitude. This stellar mass must therefore pass beyond the limit of ordinary telescopic vision. From this we may infer that not only our sun, but every star visible to the unassisted eye, forms an integral part of the Via Lactea. The eminent Russian astronomer, the late P. G. W. Struve, has remarked that "if we consider all the fixed stars which surround the sun as forming one great system, that of the Milky Way, we are in perfect ignorance of its extent, and we have not the least idea of the exterior form of this immense system of worlds."

The magnificent appearance of the south meridian midnight sky of December is principally due to the prolific region occupied by the constellations Taurus and Orion. Aldebaran, the chief star in Taurus, is exactly midway between Bellatrix and the Pleiades. The vicinity of Aldebaran is unusually rich, and includes the group of the Hyades. This brilliant assemblage of stars has been thus eulogised by the astronomical rhymester:—

"In lustrous dignity aloft, see Alpha Tauri shine,
The splendid zone he decorates, attests the power divine:
For mark around what glitt'ring orbs attract the wandering eye,
You'll soon confess no other star has such attendants nigh."

Brilliant as the constellation Taurus is with respect to the number of visible stars, it cannot in any way equal Orion for the magnitude of its components. In the latter, the universally known three stars in the belt shine conspicuously by reason of their close relationship, as well as by their equal lustre. If to these we add the four forming the quadrilateral of Orion, we have the most attractive stellar group to be found in the sky. Betelgeuse and Rigel are two of our brightest stars. Bellatrix and the three glittering gems in the belt are of the second magnitude. Although Orion is not a very extensive constellation, yet it contains seventy-eight stars from the first to the sixth magnitudes. In the following diagram, we have given a representation of Orion, including the names of all its principal members, in order that the reader may be able to make himself acquainted with the individual stars of this favourite group as they appear in the sky. It will be perceived, by an inspection of the diagram, that the great brilliancy of the group consists in the quadrilateral and its inclosures, which unitedly form so great a contrast to the surrounding space, in which the paucity of stars is very marked, especially to the east, or left-hand side of the diagram occupied by Monoceros. The positions of the principal stars in the symbolical figure of Orion are as follows:—Betelgeuse on the right shoulder, Bellatrix on the left shoulder, Rigel on the left ankle, Kappa on the right knee, and the three stars Delta, Epsilon, and Zeta on the girdle or belt around the waist of the giant-warrior. The reader is referred for further details of the two constellations Taurus and Orion to the descriptions given in January.

The north and south sky-views for December 15th will also be available at 4 A.M. on October 15th, at 2 A.M. on November 15th, at 10 P.M. on January 15th, and at 8 P.M. on February 15th.

In December, 1868, three of the most brilliant of the planets are visible during the month, either in the morning or evening. Mercury is not in a very favourable position. He rises about an hour and a half before the sun in the first week, after which the interval

6th at 9.34 P.M.; new moon on the 14th at 1.33 A.M.; first quarter on the 22nd at 4.28 A.M.; full moon on the 29th at 1.48 P.M. She is nearest to the earth, or in perigee, on the 4th and 31st, and farthest from the earth, or in apogee, at midnight on the 19th.

MAP OF THE CONSTELLATION ORION.

gradually decreases till the last week in the month, when the planet and sun rise and set nearly together.—Venus is still a morning star, and a conspicuous object in the south-east. She rises on the 1st at 4.9 A.M., and on the 31st at 5.36 A.M. Venus is now passing on towards her superior conjunction with the sun, which takes place on the 9th of May, 1869.—Mars is daily increasing in magnitude and lustre, and is visible throughout the night. He rises on the 1st at 10.4 P.M., on the 15th at 9.30 P.M., and on the 31st at 8.36 P.M. Mars is situated in the constellation Leo near Regulus.—Jupiter is the evening star of the month. He is on the meridian or due south at 7.34 P.M. on the 1st, and at 5.43 P.M. on the 31st. He sets about due west soon after midnight.—Saturn rises and sets nearly with the sun; he is consequently very unfavourably situated for observation, either with the naked eye or through a telescope.—Uranus and Neptune are both in good positions for telescopic observation, the former in Gemini, and the latter in Pisces. Uranus may be seen through a small telescope, but Neptune is of too small a magnitude to be found without the aid of a superior instrument fitted with the necessary graduated circles for the purpose of setting to its exact position in the heavens.

At the beginning of the month the moon is in Gemini. On the 5th she is in Leo, near Regulus and the planet Mars, which on this day is in conjunction with the moon. She is not far from Venus on the morning of the 11th, from Mercury and Saturn on the 13th, from Jupiter on the evening of the 22nd, and from Aldebaran on the 27th. On the evenings of the 16th and 17th, the moon will appear as a fine crescent in the south-west near the horizon. Her principal phases or times of change are as follows:—Last quarter on the

ON THE ROAD.

BEFORE the days of iron rails and flanged wheels to fit them, before the days of "harnessed fire" and steam whistles, and express trains, I knew a little about travelling. Those who then desired to travel and had no conveyance of their own, were thankful enough to travel "by coach." Travellers were then comparatively few; their journeys were also comparatively few, and far between, and the rate of progress would now be reckoned *decidedly slow*. It was considered a great achievement when a four-horsed coach made the journey between Wolverhampton, Birmingham, and London in twelve hours. The proprietors who first undertook to accomplish this, continually advertised their coach in great black letters as "THE WONDER!" never omitting the note of admiration following the name. "The Wonder" was looked upon as the handsomest "turn-out" on the road. The coach was a pattern of build, spotlessly clean and bright, at least when starting. The guard and the bugle, the coachman, "the ribbons," and "the cattle" were the first of their kind. To see the coach start from the Swan Inn was deemed by "connoisseurs" quite a treat. "The Wonder" was set a-going when I was a schoolboy, and in our school it was held in no small admiration. The boys who admired fine horses and a "fine whip" were wont to steal out, as occasion served, to enjoy the treat of seeing "Dick Evans," as they impertinently called him, drive out of the Swan yard and up the hill. "The Wonder" always started from the yard, passing through a gateway or opening beneath a portion of the inn. The gateway was narrow and its roadway still narrower, being bounded at the junction with the street by two large dumpy blocks of stone, which left but a minimum of spare space beyond the breadth of the wheel track. The street itself was not wide, and ran at right angles with the roadway from the yard, so that a very sharp turn was of necessity demanded to bring the four horses and the coach out of the yard. The performance of this feat with four fresh, spirited animals, and without the slightest help from any man at the horses' heads, never failed to secure applause from certain sporting gentlemen, and certain big and little boys, to say nothing of accidental passengers in the street, and strangers staying at the inn.

I have said "The Wonder" was looked upon as "the handsomest turn-out" on the road. You might have thought so had you seen the start. A pleasant sight it was on a fine clear morning. The bright yellow coach, with its lettering of gold and black, and its wheels picked out with black, always looked as if it had just come from the builder's. The beautiful well-matched horses, with sleek smooth skins, and brilliant jet harness with silver-plated mountings, might have been the envy of a nobleman.

Though the fare was not lower—I think rather higher—than by other coaches, "The Wonder" commanded the preference. It seemed as if the proprietors conferred a favour by booking places, whilst passengers accepted as a privilege the opportunity of getting them. Consequently "The Wonder" was always full, and most exact as to time. The luggage was promptly stowed,

and every passenger was settled in his place before the striking of the clock, the only vacant places being those of the coachman and guard. The guard swung himself to his place behind, and took his bugle from its basket, which hung beside his seat. "Dick," the chief proprietor, a master of his craft, who drove the coach the first stage, came out from the office with all the addition to the appearance of his fine person that tailoring and dress could give. What a smooth silky hat! You might have thought that, like the coach, it must be a new one every morning. What a rich shawl necktie! What a magnificent breast-pin! What a choice flower in the button-hole! What a contrast to certain dingy drivers of to-day! The reins and silver-mounted whip were taken in hand, and "Dick," as if he scarcely touched the steps, sprang to the box-seat, and on the first stroke of the hour the start was made. The skill of the driver was displayed in passing the aforesaid dumpy blocks of stone, deftly turning the angle of the gateway, and bringing his horses into line with the main road, whilst a burst of music broke from the bugle of the guard.

Punctuality was the soul of progress. "The Wonder" did not, whilst in motion, actually get on much faster than other coaches, but the guard strictly kept time, and not a moment was lost by delay. Others were long enough in changing horses to allow passengers to get down and up again; but with "The Wonder" none dismounted. At each stage the horses were kept to their pace till sharply pulled up at the station for the relay. Before the wheels were stayed, the driver unbuckled his bunch of reins, and was prepared on the instant of stopping to throw down two ends on each side. Four men were waiting, each of whom dexterously released a horse, and smartly substituted a fresh one in its place. Every moment thus gained was given to the general progress, and "The Wonder," without much extra wear and tear, accomplished its journey in less time than any of its predecessors, publishing to all thoughtful observers a striking moral on the value of moments. Rival and afterwards companion coaches were put upon the road, and it soon became a matter of course to do the journey in the same time with equal convenience.

In one of these opposition coaches I once had a narrow escape. As we were going down a hill, at the foot of which stood the posting-house, the horses turned restive: the driver lost control of them, and they started off. Thus I got the benefit of the fastest ride I ever had on a turnpike road. On our right side was a path, raised about six or nine inches from the road. I sat behind the coachman at the end of the seat next the foot-path. When we had gone some distance the wheels on that side were drawn up on the pathway for a few yards, and then suddenly came down with a jerk to the level of their fellows, though this level was not long retained. The coach received a swinging motion, so that as the horses furiously tore along it ran alternately on the two wheels to right or left, threatening to fall over, now on this side, and now on that. Towards the foot of the hill, where the ground approached the level, we saw that the road had been raised as an embankment above the adjoining meadows. We observed also that on the right-hand the footpath was without rail of any sort. There was what might be called a sunk fence. At this point the wheels again came upon the pathway; and as it seemed to me looking steadily down, the seat on which I sat was so carried over the edge of the sunk fence that I looked down perpendicularly on the sod in the field. How well I remember instinctively preparing to swing my legs outwards so that I might

come feet first to the ground, though this would probably have been of little use, since other passengers beyond me on the same seat would have most likely crushed me in the fall. Just then, in the critical moment, the top of the coach took its swing towards the left, the horses returned to the middle of the road: and at the next swing to the right, the wheels under me came to the ground with a bounce, and we were saved from falling into the field. Unchecked in speed, the horses still flew onwards, though we were in sight of the posting-house, where four fresh horses standing opposite were waiting for the change. As we passed, the wheel on my side struck the hinder part of one of these waiting horses, who stood diagonally to the course of the road. I saw the poor beast suddenly go down before the stroke, rolling over almost on its back. The collision gave us no small jolt, and yet we were not overset. We had scarcely time to note how the grooms and ostlers stared. They took care to stand clear, and to give us "a wide berth." From the posting-house the ground began to rise, and directly before us lay a long steep hill. From the time of the "bolting" till now, not a word had been spoken, except perhaps by the coachman in his first attempt to check the runaways. As we came to the rise of the hill "coachee" began to swear at the horses, called them by the worst of names, slashed their hides fast and furiously; fiercely wished his "whip wor" strong enough to cut them up to ribbins."

"I'll teach you to run away. *I will!* You've come *nicely* down hill, *you have*, to please yourselves; and *now*" (as the whipcord whistled in the air) "you shall go fast enough up, to please me!"

Never surely were horses so flogged, *secundum artem*, before—hardly one passenger, I am afraid, for the time, giving them a grain of pity.

At what a rate were we whirled up that steep! till at last the stride of the beasts shortened; the pace slackened with a sort of collapse; and no flogging could induce them to "get on." At last we came to a dead stand. The jaded brutes, with a drunken reel, blowing, sweating, steaming, seemed ready to fall against each other.

They were then turned about, driven down the slope again, and this time *easily* brought up at the inn, only too glad to pause at last. Every passenger dismounted the moment the wheels ceased to roll. All breathed freely. What each might feel I cannot say; but I do not remember any distinctive acknowledgment of Providence, or utterance of gratitude. "It was a near chance." "We've had a lucky escape." "What a good job we had no women here."

We found one of the four fresh horses completely disabled. Poor creature!

"You can't go on with *him—that's sure*," said one of them, pointing to the maimed animal.

"He'll ne'er go n'more," said another.

"There's nought for it but to shoot him," ejaculated the landlord.

"He'll be a dead loss to *somebody*," said a calculating passenger.

"It's a wonder ye weren't all spilt," said a bystander.

While coachman, guard, and landlord discussed what was to be done, and whether a substitute could be found for the wounded horse, I thought there would be time to go and look at the embankment and the meadow, where we had so nearly been capsized. On examining the spot, the course of the wheels could be easily traced by a deep rut in the gravel, which abruptly ceased at the edge of the embankment, and was again continued

a yard or two further on, showing that the wheels on that side must have passed over some distance in the air, at the height of at least three feet from the sward below. As I stood and imagined the course of those wheels above the open field, and remembered the opportune swing of the coach in the safe direction at the critical moment, I saw most distinctly the peril of which I had a pretty strong impression in passing it. I shuddered at the remembrance of the possible catastrophe, which when imminent had hardly moved me, and I felt that our deliverance had been marvellous.

I am afraid I had, at the time, no very distinct or devout recognition of Divine Providence, but in after life I have often recalled it with surprise, and felt thankful for this merciful preservation. But for this, I might have been maimed for life, or cut off with short warning.

But it was not my purpose to run off into old recollections, on seeing the picture of the mail at Christmas-time. This is a scene which I once saw on the road. The mail was changing horses at the Red Lion. Like our own coach, the mail was hung round with game of all sorts, sent from country sportsmen to their cockney friends. The hares, with their downy fur, and the birds, with their bright feathers, made a show which it was then thought a sight to see on a Christmas coach. The body of the mail, a fine deep red, strengthened by dark shadows cast from its abundant top fringe of game, contrasted with the neutral luggage; the sombre dress of the passengers, the grey horses just released from the trace-hooks, and the dull surroundings, formed a central mass of well-ordered form and rich warm colour, the more striking to an artist's eye from the winter accessories—a leaden sky, trees feathery with frozen rime, snow-covered roofs, and a snow-clad landscape with dazzling breadths of light borne out by shadows characteristically cold.

LIFE-BOAT SERVICES.

WE are unwilling to allow the year to close without reminding our readers of the services and the claims of the Royal National Life-boat Association. We happened this summer to be at Lowestoft on the day of the annual inspection of the life-boats of that port and of the adjacent parish of Pakefield. Besides the trial of the two life-boats, an exhibition of Capt. Manby's rocket apparatus for communicating with ships in distress, and other interesting experiments, formed part of the proceedings. Having made special inquiries as to the services rendered by the Lowestoft and Pakefield boats, it occurs to us that a brief notice of some of these may serve better than any general statistics to exemplify the humane and beneficent work of this noble institution.

On the 7th October, 1858, at eleven a.m., the barque *Zemira*, of Leghorn, with twelve Italians and an English pilot on board, ran aground on the Newcombe Sands, near Lowestoft, the wind blowing a hard gale from the S.W. at the time. The Pakefield boatmen, as soon as possible, launched the life-boat; but the greater part of their number being absent in Lowestoft Harbour, they could not be on the spot immediately; she was, however, afloat in about forty minutes, but the vessel had then broken up and disappeared. The life-boat's crew, nevertheless, determined to search the spot where she had been, with the chance of picking up any of her crew who might have been able to hold on by pieces of the wreck. On crossing the shoal, in a very heavy sea, the whole boat and crew were once completely immersed;

but, nothing daunted, they prosecuted their search, and happily succeeded in picking up eight of the crew floating about on pieces of the wreck at various distances from the spot, the last man picked up being two miles distant from where the main part of the vessel remained. The captain, three of the crew, and the English pilot, unfortunately perished. This service was considered to be altogether of so gallant and praiseworthy a character that the Board of Trade awarded medals to the coxswain and crew; and a considerable collection (£60) was raised by visitors at Lowestoft in testimony of their admiration of it, and given to the crew, who also received the highest scale of payment allowed by the National Life-boat Institution, viz., £2 to each man—10s. each being the ordinary sum for day service in its life-boats.

On the 26th October, 1859, the schooner *Lord Douglas*, of Dundee, parted from her anchors in a heavy gale from the south, and foundered off the village of Corton, on the Suffolk coast. The Lowestoft life-boat proceeded under sail to the spot, and having anchored to windward of the wrecked vessel, the crew of which had lashed themselves to the rigging, succeeded in saving them, five in number, drawing them through the water by lines thrown to them, and landed them safely at Corton.

On the same afternoon the Lowestoft life-boat performed another valuable service. Scarcely had she returned from saving the crew of the *Lord Douglas*, than another schooner, the *Silva*, of Glasgow, drove ashore at Corton, although lying with three anchors ahead. The life-boat had split her foresail in the previous service, but another was borrowed, and she again started on her mission of mercy, which, happily, was crowned with similar success, and the crew of the wrecked schooner were taken off in the same manner. Having split her borrowed foresail, the life-boat was compelled to land on Yarmouth beach, where the shipwrecked men were hospitably received into the Sailors' Home. The life-boat had to be left at Yarmouth until the 28th October.

On the 1st November, 1859, the crew of this valuable and efficient life-boat had another opportunity to distinguish themselves. The screw-steamer *Shamrock*, of Dublin, ran ashore on the above-named day, on the Holm Sand, during a heavy gale from the S.W. The Lowestoft life-boat was launched as soon as possible after the situation of the unfortunate vessel was perceived, and proceeded under sail to the spot, when she anchored, and the crew of fourteen men were with much difficulty hauled into the life-boat by lines thrown to them. The sea was said to be breaking over the mast-heads of the steamer, and repeatedly filled the life-boat. The danger of the service was much increased by the circumstance that a great expanse of shoal water lay close to leeward of the boat, and if her cable had parted, it was considered that the destruction of the boat and her crew might have followed. For this service the life-boat's crew received double the usual payment, or £1 each; and in testimony of admiration for this and previous distinguished services in the life-boat, the following men had, in addition, the silver medal of the institution awarded to them:—Richard Hook, coxswain; Francis Smith, Richard Butcher, Alfred Mewse, Thomas Liffen, James Butcher, and William Rose.

On the night of the 2nd November, 1861, the schooner *Fly*, of Whitby, was in a leaky state, and in danger of foundering near Lowestoft, in a heavy gale from the north. On her making signals of distress, the life-boat of the National Life-boat Institution, at Lowestoft, was launched through a tremendous surf, and proceeded to

her assistance. Some of the life-boat's crew were placed on board, and succeeded in taking her safely into Lowestoft Harbour. The vessel and her crew of four men would probably have been lost but for this aid.

On the 10th November, 1861, the Lowestoft life-boat was again instrumental in saving lives. The barque Undaunted, of Aberdeen, struck on the Newcombe Sand, in a south-westerly gale, and hoisted a signal of distress. The Lowestoft and Pakefield life-boats both put off to her aid, and together took off her crew of eleven persons, landing them safely. The barque shortly after became a total wreck.

Again, on the 14th November in the same year, two small vessels, the pilot cutter Whim, and the lugger Saucy Lass, were seen to be at anchor on the weather side of the Holm Sand, in an extremely dangerous position, and with signals of distress flying. A steam-tug was seen to be near them, but unable to approach near enough to render them any assistance, as the wind was blowing a heavy gale at the time, and a high surf was breaking on the sand. The Lowestoft life-boat was quickly launched, proceeded under sail to the sand, and succeeded in rescuing the crews of both vessels; the steamer towing her to windward after her rescue of the crew of the cutter, to enable her again to drop down into the broken water to the aid of those on board the other vessel. Seven men were taken from the cutter by the life-boat, and eleven from the lugger.

On the 26th February, 1862, the services of this valuable life-boat were again called into requisition. Early in the morning the boat of the brigantine Matilda, of Stockholm, with four of her crew and a Lowestoft pilot on board, found their way into Lowestoft Harbour, and reported that their vessel, with six more men on board, was ashore on the Corton Sand, and fast breaking up. The harbour steam-tug had, fortunately, her steam up at the time, and the Lowestoft life-boat having been manned, she took her in tow and conveyed her to windward of the sand, where they found the unfortunate vessel a broken-up wreck. The life-boat quickly made sail to the spot, and dropping her anchor amidst the broken fragments of the wreck, succeeded in rescuing four of the unfortunate vessel's crew, the remaining two having been washed off the wreck and drowned before her arrival. Captain Rivers, harbour-master of Lowestoft, went out in charge of the tug, without the aid of which the life-boat would not have reached the wreck in time to have been of service.

On the 23rd May, 1867, during a strong breeze from the N.E. by E., the brig Amicizia, of Genoa, was observed to take the ground in the Stanford Channel. The Lowestoft and Pakefield life-boats both put off to the rescue of the crew. The first-named boat arrived alongside the wreck first, and took off ten men from the rigging, afterwards landing them in safety. The Pakefield life-boat succeeded in rescuing the remaining four men. The vessel soon afterwards became a total wreck.

These cases are selected from a detailed record now before us, of all the services rendered by the Lowestoft and Pakefield boats. No storm, however violent, no hour of the night or season of the year, ever deterred the gallant crews from promptly hastening to the help of ships in distress. On many occasions master mariners and officers of the Royal Navy have led the way as volunteers to man the boats. The name of Captain Joachim, R.N., deserves to be mentioned, a veteran sailor, and one of the most gallant officers that ever went afloat on such emergencies, as his silver medals and

clasps with which he has been decorated by the Association honourably attest.

Since 1855, when these two boats were brought into connection with the central institution in London, they have saved about 220 lives from various shipwrecks on the Suffolk coast. And these are but specimens of the services rendered in this good cause by the 190 life-boats of the National Association all round the coast of Great Britain.

Original Fables.

BY MRS. PROSSER.

INCONVENIENCES OF "THE HIGHFLOWN."

"BAA, baa!" cried the little Lamb. "I've lost my mamma. Ah, who has seen my mamma? Baa, baa, baa!"

"Poor little heart!" cried an old Sheep that was busy nibbling the sweet short grass when the cry attracted her. "How long have you lost her, my dear?"

"Oh, a long, long time, and I can't find her anywhere. Baa, baa!" cried the little Lamb.

"Well, don't fret; I dare say she is not far off," said the kind old Sheep. "You look very tired; come and eat a bit of this nice grass, or lie down and rest, and I will go and look for her."

"Oh, thank you!" said the trembling Lamb, lying down at once.

"What is she like, my dear? Is she like *me*?" asked the old Sheep, as she turned to go on her search.

"Oh, dear, no!" cried the little Lamb, as if shocked at such an idea. "My mamma is so pretty; her fleece is as soft and as white as the clouds up there, and her eyes—oh, they are so beautiful!"

The old Sheep paused and looked thoughtful. "I don't remember ever to have seen one of our party like that, but I suppose I haven't taken notice enough. I shall be sure to know her at once *now* that you have described her," she said, and away she went.

She examined every sheep she met, but saw none a bit better looking than herself, so she passed all without asking if they had lost a little lamb.

"I am very sorry to tell you, my dear," she said when she returned, "I am afraid they must have taken away your poor mother, for nowhere can I see her, and I have been all over the field."

"Baa, baa!" cried the little Lamb, piteously. At that minute a sheep appeared on the top of the bank under which the Lamb was lying, and cried out loud, "Baa-aa-aa!"

Up started the Lamb and skipped up the bank, crying, "Mamma, mamma! Oh, cruel Sheep, how could you say she was taken away from the field?"

"Cruel!" cried the Sheep, much surprised. "Why, how in the world was I to know that *that* was your *mamma*, after the description you gave? Learn to keep to sober truth; if you had not been so highflown, I should have found her directly, and saved you pain and myself a world of trouble."

LET ANOTHER PRAISE THEE.

"WHAT a wonderful fellow Mr. Blazes is," said Dull, the pack-horse, to Conjurer, the old hunter.

"Blazes *wonderful*, is he?" said Conjurer.

"Oh, astonishing," replied Dull; "he was always considered the finest horse in the stud for symmetry and beauty; and then his swiftness in a race, his spirit and dexterity in leaping, his untiring strength; in short, his excellence in all ways was marvellous."

Conjurer did not reply, and Dull continued—

"And the prizes that his family have won, and the fame they have! Any bet may be made on the breed; they come off with flying colours from every field and course; unexampled success, and unfailing, attends them."

"Where did you get all this?" inquired Conjurer, who had his own opinion of the merits of Mr. Blazes and his breed.

"From the best possible authority," said Dull,—"himself."

"Ah, so I thought," said Conjurer. "Let me advise you,

my good fellow, when you hear an account like this from an enemy, to believe it all; when you get it from a friend, to go half way with it; but when it comes from 'the Wonder' himself, to take it for as much as it is worth, and that is—nothing at all!"

MEUM OR TUUM MAKES ALL THE DIFFERENCE.

THERE was a debate in the yard. Commodore, the old house-dog, was delivering himself on the merits of Tip's case, and the magpie, the stable-cat, and Crib, the terrier, were listening to him.

"I cannot say, my friends," he began, "that the punishment of our companion Tip seems to me to be a just one; and the cries that we recently heard following the blows he received grated very harshly on my ears."

His hearers looked much impressed, especially the magpie, who surveyed him attentively.

Flattered by this deference, he continued, "Far be it from me to defend the crime of theft; it is a disgraceful act in itself; but *then*, when it has to be judged, all the circumstances of the case should be taken into consideration. You understand me, Mag" (he added a little severely), "a thief, without palliating circumstances, is a despicable creature."

"O yes, sir, I understand," said Mag, demurely.

"Very well, then, let us put Tip's case. Here, as it might be" (pointing to a piece of meat that he was going to dine on) "stood the butter-basket, full of the fresh-made luxury, which we all know is most delicious."

"Did cook ever give you any, sir? I couldn't have known that it was delicious if I hadn't made free with a pat or two," said Mag.

"That's an irrelevant question," said Commodore, rather confused. "I was saying that butter is delicious; and here stood the basket, *full* and *uncovered*, most inviting. Well, on the other hand, *there* stood Tip, exceedingly hungry, and having a particular love for nice things at all times; and where was the dairy maid, whose place it was to watch the basket? Alas for Tip, she was nowhere! Any one may supply the event. Tip fell beneath the clear opportunity and the strong temptation, and I confess, viewing the case dispassionately, I wish he had not stayed to take a second roll, and so got found out and thrashed!"

Quite satisfied with the effect he seemed to have produced, Commodore returned to take his dinner—but it was gone.

"It's down the drain by this time," said Mag. "I saw a rat at it, but you didn't like to be interrupted."

"The villain!" said Commodore, rushing to the drain. "Such a slice of liver I haven't had for this week or more. I'll make him pay for it; I'll have him!"

"Do but hear," said Mag. "I dare say he was much more hungry than Tip, and I'm sure you were quite as careless as the dairy maid. But nobody is to be trusted, however finely he may talk, where his own is concerned; dispassionate views and liberal principles won't stand against self-interest."

JUDGMENT VERSUS JUSTICE.

"PADDLE," said the Cat, "can you tell me the difference between a fault and an accident? for I get kicked and cuffed at one time, and let alone at another, for the very same thing, and I should like to know what makes the difference between them."

"The difference, dear Tabby, is *this*," said Paddle: "if I, by mistake, took your dinner, it would be an accident, but if you took mine, it would be a fault; and it is just on that principle that Betty visits your misdemeanours with wrath or forgiveness."

THE POWER OF LOVE.

"WHAT a horrible noise he makes!" said the Reeds.

"Horrible," said the Rushes.

"Like a bull bellowing," said the Reeds.

"Like a horse neighing," said the Rushes.

"He makes the very earth shake!" they exclaimed together.

"Ah, song beloved," said the bitter's mate; "harsh and dissonant to many, but sweetest music to me. How it rejoices my heart to listen to it!"

"Only hear her," whispered the Reeds to the Rushes. "Well, it only shows what love can do."

Varieties.

THE BOURBONS.—All the living members of this family are descended from Louis XIII of France, who had two sons—Louis XIV and Philip Duke of Orleans (the latter is now represented by Louis Philippe, Count of Paris, who claims the crown of France). Louis XIV married the eldest sister and heiress of Charles II of Spain, and had an only son, who died before him, leaving three sons—the first was Louis Duke of Burgundy (who was the father of Louis XV, and is now represented by Count de Chambord, who claims the crown of France as Henry V); the second, Philip V of Spain (in right of his grandmother), married twice (his second wife being heiress of the Duchy of Parma), and left five sons—the three eldest (Louis, Ferdinand VI, and Charles III) were successively Kings of Spain, and the fourth was (in right of his mother) Duke of Parma, and is now represented by Robert of Parma. Charles III left five sons—viz., Charles IV of Spain, Ferdinand I of Naples, Gabriel, Anthony, and Francis. Ferdinand of Naples is now represented by Francis II. Charles IV of Spain married Louisa of Parma, his cousin, and left three sons—viz., Ferdinand VII (the father of Isabella II), Don Carlos (who claimed the throne as heir male of his brother Ferdinand), and Francisco. Don Carlos left three sons—1st, Carlos Count of Montemolin, who died three or four years ago without issue; 2nd, Don John (the father of the present claimant and two other sons); and, 3rd, Don Ferdinand. The third son of Charles IV, Don Francisco, left a large family, and his eldest son is the husband of Isabella II. It will be thus seen that the eldest, or French branch, is represented by the Count de Chambord; the second, or Spanish, by the Count de Montemolin; the third, or Neapolitan, by Francis II; the fourth, or Parmesan, by Robert Duke of Parma; and the fifth, or junior French, by the Count of Paris.

CORRESPONDENCE OF NAPOLEON I.—Another volume—the twenty-third—of this correspondence has been published. It deals principally with the period of the Peninsular war. One thing is shown throughout the volume. Notwithstanding his gigantic preparations the Emperor was as omnipresent and meddling as ever in the details of government. He thus refers to the letters of a lady which he had opened:—"Write to Marshal Suchet to complain that the correspondence of his wife with Madame Saligny refers to what happens in the army. Such things ought not to be found in a woman's letters. She should know nothing about the strength of the troops or the movements that are being made. Her letters should be about her health, and that is all." He had an eye for the reports of his spies, and wrote thus about Bourmont in 1812:—"You have made Adjutant-General Bourmont—that is, a man who has been a Chouan leader—Commandant of the Department of the Apennines. That is absurd. This officer should not be employed except under strict surveillance." The following, written when crossing the Niemen, in the midst of incessant cares and toils, has the touch of nature that makes all mankind kin; it provokes sympathy when we reflect on the destiny of the imperial child:—"Madame Montesqui, I have received your letter of the 6th of June. I can only express to you my thanks for the care you have taken of the king. I hope you will soon let me know if his last four teeth have been cut. I have given orders that the nurse shall have what she requires."

LORD LYNDBURST.—A friend of mine, conversing with the late Lord Lyndhurst, pressed upon him the fact that faith in Jesus Christ was inseparably connected with Jesus Christ himself, and produced holiness of heart. The aged nobleman listened with great interest, and said: "I thought that, at ninety years of age, I had known everything that man thought about religion; but I never heard at all that there was any faith that by its own nature and of necessity produced holiness, and I never knew that any man held that there was such a faith as that." His lordship, however, was intensely interested with this faith; and he received it as a little child, and entered into the joy of his Redeemer.—*Rev. A. Moody Stuart.*

HAY FROM AMERICA TO GREAT BRITAIN.—The hay crop of the United States in 1867 was reported at 21,778,627 tons, and its average value at 15 dollars per ton. The crop this year is said to be much larger. Sailing vessels can bring hay to Liverpool from the Atlantic ports of the United States, and from the western cities by way of the Lakes and the St. Lawrence River, and land it there at 50s. a ton, with a good margin of profit to the shipper.

THE RESCUED BIBLE.

THE EXILES OF SALZBURG.

CHAPTER XVII.

HANS now thought it advisable to prefer the claim of his wife and her two brothers to the Schüppelhof before the judicial court at Werffen. It was on the morning of the 24th of November, 1731, that, accompanied by the young brothers-in-law, he arrived at the miniature city of Werffen. Smoke, sparks flying upwards, and the glow of fire, first attracted their attention in the market-place. They drew near, and beheld with the greatest astonishment, in the midst of the square, an immense

quantity of books of all sorts piled up, which the deacon of Werffen, assisted by several of his servants, was, with holy zeal, endeavouring to kindle into flames. Already innumerable tongues of fire might be seen darting between the dry, parched leaves; its glowing breath had even consumed the thick leather bindings of the volumes. Mournfully but in silence the inhabitants surveyed at a distance the bloodless *auto da fé*, for which the deacon had been preserving all the Protestant books which he had taken from them for the last twenty years. What a mass of Bibles were devoured by the flames! What columns of fire ascended to heaven from the

multitude of Protestant works, from Luther's thick Domestic Expositor down to his small Catechism! The writings of Arndt, Spangenberg, Dillherr, and many other theologians, all found here a glowing grave. Hans gazed sadly at this detestable act. A Bible, borne by the force of the flames and wind, partly consumed, fell at his feet. In an instant it was concealed under his coat, though it burned his waistcoat. Rejoicing in his prize, he was about to retire with the two boys, when they found themselves unexpectedly stopped by some imperial soldiers. At first he attributed their detention to the Bible which he had concealed, but he soon discovered that all the bystanders were subject to the same fate. They were all driven together into a group, which consisted of men, women, and children, all equally lost in astonishment. A fearful light now dawned upon them, when they saw those who were proprietors selected from them and made to stand aside, and the non-proprietors driven along without delay. The latter, they found, were to be expelled from the country at once without ceremony. Among these were Hans, and Manlicken's sons, although Hans had endeavoured to establish their right to remain on account of their father's property, and by the production of Pommer's deed of gift. But the officer in command drove the lads back into the crowd of the rejected. Packfest, their faithful dog, received a sabre cut on his leg from this hero, as he was about to revenge the violence offered to his masters, who, taking their bleeding favourite in their arms, were now glad that they were to quit a country in which even irrational creatures were not spared by the brutal soldiers.

Some of the poor people now entreated permission to go to their homes and procure warmer clothing, some to take leave of their friends, and others to provide themselves with money for the expenses of their long journey. Their urgent prayers remained unheeded.

"Salute my poor wife," cried Hans, on parting with an acquaintance who had stopped behind, "and Manlicken's wife; tell them not to grieve on our account. It may be that God for us will—"

His words were lost in the loud lamentations of his fellow-sufferers, and in a short time they were out of sight of their brethren, who remained behind in a state of stupefaction. Every now and then the outcasts were joined by similar groups coming from different quarters; so that at last the entire body had augmented to eight hundred men, who were all thus expelled from Salzburg.

Long before the surly cornet, upon committing his charge to a stronger escort, had returned even to Werffen, he met a young woman coming along in tears with a little boy in her arms.

"Whither art thou going?" he rudely asked her.

"To my husband," she answered with difficulty.

"Thou wilt stay here," he austere commanded.

Barbara, now throwing herself upon her knees before him, said, "May God forgive me that for the first time in my life I kneel to a human being; but I implore thee to let me go to my husband, and this child to his father! Have pity on me, dear sir."

The cornet bit his lips, but gave her no answer. Then dismounting his horse and dismissing his men, he grasped Barbara by the arm, and forcibly led her back to her cottage. She wept in silence, her child cried aloud; but the grief of the afflicted and forsaken creatures neither moved the hard-hearted man nor the two dragoons by whom he was attended.

Arrived at the house, they found the soldiers who were quartered there in a room loudly vociferating and drinking.

"Sluggards! that ye are," said the cornet, in reproof. "Oh!" answered the intoxicated men. "We have not been idle, we have been endeavouring to assist the priests in converting our hostess, but the heretic mistress of the house has escaped from our efforts, and is nowhere to be found."

A new cause of alarm for poor Barbara! In the greatest anxiety she hastened out of the room with her child, followed by the prying cornet. Not a corner remained unsearched. Loudly and frequently she called out her mother's name, but, alas! in vain.

The most dreadful apprehensions now filled her mind. There stood the dough prepared for the oven, which was already heated for the purpose of baking it.

* * * * *

The horrors of the scene which Barbara witnessed are here spared to the reader. When the drunken soldiers found that the poor woman had taken refuge in the heated oven, they shut her up there, heedless of her cries of agony.

* * * * *

Barbara sat by the charred corpse. She could not weep, and her brain seemed on fire. Bereft of father, mother, husband, and brothers, she possessed only her little Peter, who, unconscious of his mother's wretchedness, playfully wound his tiny arms around her neck.

After some commiserating neighbours had interred the deceased without psalmody or passing-bell, and in unconsecrated ground, according to the decree issued by the archbishop against the heretics, Barbara was desirous of rejoining her Hans, and of quitting a country where she and her child never more could hope for happiness; but this too was denied her. By some influence her efforts to escape were hindered. The commander frequently came himself, always to the great terror of little Peter, to whom the grim soldier was an object of aversion.

The winter now set in, with its frost, its snow, and its ice. When Barbara was lying sleepless upon her bed, and the wind was howling and moaning around her cottage, driving flakes of snow against the window-panes, thickly frosted over, she would fancy that she heard the voice of her Hans outside piteously entreating for admission. "Where may he be now?" she would ask herself. "Has he a shelter from the benumbing cold?" And then she would dream that she beheld him, trembling with cold in his tattered clothes, wandering about in snow and ice, and with true affection carrying her wearied brothers upon his shoulders; then she would see him cross the deceptive surface of a snow-covered lake, which breaking in, they all sank together, without any one hearing their cries for help. Starting in terror, she would spring up from her bed, the old servant awaking would scold her, while little Peter cried out loudly, thinking that the savage soldier had grasped him, when it was but his mother, who had embraced him in her agony.

At length winter departed, the snow dissolved, the avalanches thundered down into the re-echoing valleys from their lofty heights, torrents rushed along, the grass resumed its verdure, and the blossoms cast off their winter sheathes; the glorious sun ascended higher and higher as spring advanced, and the larks sprang upwards with their songs of jubilee proclaiming the goodness and glory of God. Bleating and lowing with joy, the herds moved to the fresh pastures of the Alp; multitudes of lambs and goats frisked and sported around; the joyous sounds of pigeons and poultry, ducks and geese, now filled the air. Man alone was seen to walk in silence and with downcast eyes through the spring-revived pastures.

CHAPTER XVIII.

It was on a fine day in May, in the year 1732, that a travelling mechanic appeared at Barbara's door. As she was kindly offering him a piece of bread, he pointed to a paper which he kept concealed under his coat, and then rapidly and cautiously hid it under the straw of the deserted dog-kennel. "Hans and your brothers," he whispered as he went away, "send their love to thee." Barbara taking the paper and her child with her, hurried into a thicket, where, having lulled him to sleep, she with trembling hands opened the packet, which consisted of numerous leaves, written in several hands, as follows—

"Kauffbaiern, 28th December, 1731.

"May God bless thee, my dear Barbara! To learn that thou and our child and mother are well would give me heartfelt satisfaction. Myself, Frank, and Joseph, are, God be thanked, healthy and vigorous, though we have suffered much from cold, hunger, and evil people. But we are better off at present. I will relate to thee, as well as I can, all that has hitherto happened to us. Thou wilt be lost in wonder, that I have learned to write in so regular a manner: but that is not the case. The good people with whom we are lodging, at my request, have written down what thou here seest. And so I shall always converse with thee when I meet with Christian hearts. Oh! that I only knew how this letter could be conveyed into thine hands! Well, God will, I trust, give me the means of its reaching thee safely. Thou must know that when I was so unexpectedly hurried away, without being able to take leave of thee and my little Peter, my heart was ready to break with grief. Frank and Joseph were sooner resigned. They had enough to do with their Packfest, in stopping his blood and binding up his wound with their pocket-handkerchiefs, after the cowardly officer struck him with his sabre. They suffered but little from the piercing November wind, for they kept themselves tolerably warm with the dog, which they carried alternately, refusing to part with him, even when I offered to take a share in the burden. Sometimes we overtook a troop of sufferers, and sometimes others overtook us, so that our number was continually increasing. They were all poor people, day-labourers, servants, and children, as badly provided with clothes as myself. It gave us, however, some consolation, that we were not the only exiles; though I do not maintain that that was a right feeling. And only think, there came with us voluntarily one hundred and seven men, who, although Catholics, were bitterly exclaiming against the injustice with which we were treated. Thus we arrived at Salzburg late in the evening. Here, in reality, we first began to experience want and suffering. As for sleeping-places, we were thrust into cold barns and stables, where, upon hard couches, and with empty stomachs, we were left to freeze at leisure. Through fear or hatred, not a soul offered us a morsel of bread, for which may God forgive them! But an old woman perceiving that I was without a hat (for I had lost it on the way), brought me secretly a well-worn peruke, with numerous holes in it, which she procured I know not where. I blessed her for this kindness. I had already made a sort of cap and coat with twisted fir and brushwood, which in some measure protected me from the cold. As we lay as thick as herrings, the night passed off well enough. Packfest kept your brothers warm, and thus repaid the boys for the care which they had taken of him. I could not, however, close my eyes in sleep, for thou wert always standing before me with

our child. It also occurred to me how wonderfully the word of the Lord was accomplished in regard to us, where he says, 'But pray ye that your flight be not in the winter, neither on the Sabbath day.' Was it not in the winter, and on the eve of the Sabbath? Who would have thought that these words might be applied to us. Alas! I cannot conceal it from thee, though I tell it with great pain, that thirty-six of us had their minds so weakened by their affliction that they deserted their faith. May the Lord not lay this sin to their account. On the following morning we were taken to the vessels which were to carry us down the Salza. With a sad gaze we took leave of our mountains—a farewell glance we cast upon the haughty city with its cruel inhabitants, and then crowded closely together, for the air on the water was piercing cold. After that we consoled ourselves with the hymn of the pious Scheitberger, thus beginning:—

"A sorrowing exile, lorn I roam,
An exile in God's holy cause;
Banished by tyrants from my home,
Because I loved the Gospel laws.

"I suffer; but, Redeemer, Lord,
Didst thou not suffer countless woes?
Then let me hail thy will and word,
And follow thee till life shall close.

"'Whate'er may be that sacred will,
Submissively my cross I'll bear;
Thy word shall be my leader still,
And faith shall triumph o'er despair."

"The banks and mountains resounded with our voices, and we sang until the soldiers commanded us to be silent. We arrived without accident at Ditmaringen and Theiszendorf, where we remained inactive for eighteen days, during which we were compelled to find our own provisions. It was by good fortune that I had three florins in my pocket, which I had taken to pay the costs of laying the claim before the court. I had almost forgotten to tell you that I have with me a half-destroyed Bible, which I saved from the flames at Werffen. We were detained a long time at this place, because we were forbidden to enter the Bavarian territory, until at last the permission of the elector was granted. It is said to have been very graciously accorded. I must confess we did not feel sorry when we had passed the frontier of Salzburg and stepped upon Bavarian ground.

"We proceeded rapidly, for the Salzburg commissary, a Herr Von Memmingen, who was to accompany us to our journey's end, kept his horse continually on the trot. Nevertheless it was already dark, and the gates had closed when we arrived at Kauffbaiern. There we stood shivering after our toilsome march. At last we commenced singing to console ourselves, 'A firm castle is our God.' And when our devout tones were heard in the stillness of night, they touched the hearts of the inhabitants, who immediately caused the gates to be opened to us. Singing we entered the town, where we were received by the light of innumerable torches and candles. How many tears did these good souls shed at the recital of our distresses, especially when they saw our little children come tripping along with their tiny hands benumbed with cold. We were also much pitied for our clothes, which were so ill-adapted to keep off the inclemency of the weather. I attracted their attention more than any one else. And truly I must have made a strange appearance in my enormous wig, which hung half-way down my back, and in my coat of twisted green brushwood. 'Let us do good to every one, but most of all to our brethren in faith!' With these words, a gentleman in splendid attire, the moment he saw me,

offered me his costly fur cap in exchange for my wig, and then ran off with it bare-headed, with as much satisfaction as I naturally felt at the good exchange, assuring me that he should preserve it as a pleasing memento. Not long afterwards a beautiful and timid little girl brought me a very good warm coat, of such fine cloth that I almost feel ashamed to go about in it. We were then lodged in those inns of which the landlords were Protestants, or with Protestant citizens and members of council. My dear Barbara, I have never taken the gifts of God into my mouth without returning him hearty thanks, but never with such fervour as now. What refreshment, what strength, did we not receive from the warm and excellent food of which we had so long stood in need! After a stay of four days, we shall leave this place to-morrow. Care was taken of our sick in the hospital, the children were baptized, and we all received munificent gifts from the citizens and merchants. We felt great happiness in beholding for the first time a Protestant church here. With the deepest devotion, we and our innocent little children entered the venerable house of God, where there was a sermon preached particularly on our account by the Rev. Jacob Brucker. Never shall I forget the tears of joy that we shed, and the rest of the congregation wept with us. He commenced with the following words, from the book of Revelation xii. 11:—‘And they overcame by the blood of the Lamb, and by the word of their testimony; and they loved not their lives unto the death.’ But his principal text was from Matthew x. 32: ‘Whosoever therefore shall confess me before men, him will I confess also before my Father which is in heaven.’ Greatly fortified by this spiritual food, as well as by the bodily sustenance which we had received, with firm courage we proceeded farther on our way. God preserve my Barbara, and also our child, not forgetting mother Catherine, and father Manlicken, whom may he speedily deliver from his bonds!”

“Halle, April 26th, 1732.

“MY DEAR BARBARA,—I have not yet found means of having my first letter safely delivered to thee. Thou wilt, therefore, receive my communications all at once. The commencement of our journey was bad; the progress of it was sometimes bad, and sometimes better; the end transcendently glorious. May the Lord preserve us from pride and vanity! For, my dear wife, where we are now arrived the greatest honour is shewn us. If we come in sight of a village or a town, all the bells are set ringing to welcome and greet us. Waggoners are sent for the sick, the aged, and the children. Before entering any place, hundreds come out to meet us; the citizens receive us under arms—not, as in Salzburg, to strike us with terror; no! but to show their kind feeling towards us. They present arms, they beat the drums, and all is done just as if they were receiving a reigning sovereign. However, through my great gladness I have begun my story at the end, instead of the beginning. Now attend. We left Kauffbairn on the 1st January, after having experienced so kind a reception; but that we might not be dazzled by looking at the sunshine, a tempest soon followed. At Kempten, for instance, we were refused entrance by the warden, Baron Von Freiberg. In upper Bavaria, men and women, at the instigation of the priests, opposed our passage, and we dared not remain there at night. Thus it also happened at first at Augsburg, where the warden of Holzapfel, Von Herxheim, had excited the Catholic town-council against us; but, however, the Protestant town-council and citizens of their own accord took our part, and treated us with great

benevolence. On the 28th March we arrived at Donauwörth, in Oettingische, where a kind man, the Prussian commissary Göbel, gave us a welcome reception, and from that time allowed to each man four grosschen daily, each woman three, and each child two grosschen, for travelling expenses. This, however, we could not spend, so many presents were sent to us from every quarter. In Harburg we were well received, as also at Anspach, where the Margrave defrayed our travelling expenses, allowed us free quarters everywhere, and provided us with waggons.

“But the bishopric of Bamberg sternly refused us a passage, and we were therefore compelled to go back towards Nuremberg, where we fared better, as well as in the territory of Baireuth. We kept Palm Sunday (April 2) at Erlangen. The Landgravine Sophia, the widow of the late landgrave, resides here, and permitted fifty of us to visit her castle, where she treated us sumptuously; and her servants likewise took twenty of us into their houses. At table, people of the highest rank esteemed it a pleasure to wait upon us. The landgravine is a most gracious lady; may the Lord repay her a thousand-fold the good that she did to us! On the following day we left Erlangen, and were accompanied out of the city by the whole university, singing heart-cheering hymns, who, before taking leave, distributed the money that had been collected for us, in equal shares to every man, woman, and child. We kept Easter Sunday at Hof, where we likewise received the kindest treatment. On the third day of Easter we reached Schleiz, in Voigtland, where Henry I reigns with his consort Dorothea Louisa. Here the clergy came out to meet us, the citizens were under arms, and each of us received a billet for quarters. Nay, they actually struggled amongst themselves who should receive us, and some wept because they could not have us in their houses. The countess, moreover, sent us two large hampers containing linen and clothes, and one hundred and twenty dollars besides, which were all distributed amongst us. Each of us also received two pounds of bread, and two quarts of beer, not to mention what we had from the citizens. A woman of Salzburg here gave birth to a son, to which the countess, together with the Counsellor Böhme, and the Burgomaster Weise, stood sponsors, and had it christened in the chapel at the castle, and after the ceremony they presented it with some handsome gifts. At Gera the people looked with great wonder at old Eberhard Weidner, whose beard, white as snow, flowed down to his breast. In Saxony, as much as we saw of it, we were treated with remarkable kindness: presents poured in upon us from all sides. Oh, couldst thou but enjoy some of our superfluity! We were not permitted to make the short circuit by Dresden.

“‘It is but natural,’ said our friendly host at Weissenfels, ‘that our sovereign the king will not like to see you poor people, who left your all for the sake of the gospel, which he has abjured for the sake of earthly gain. He would certainly be put to shame by you!’

“Poor man, how grieved I shall be if this prove true! If he had even had ten kingdoms he could do no more than satisfy his hunger, for which he has quite means enough in Saxony. They that will be rich fall into temptation and snares. We are now entering into our new country. We have already reached one of its towns, which reminded us of our well-beloved homes. The same smell of salt as at Hallein, the same perpetual smoke, the same vast salt works.

We are soon to see our new sovereign. My heart

beats at the thought. Really, judging from what we have already heard of him and received from him on our long journey, he must indeed be the father of his people—a very different sovereign to our archbishop. We poor exiled people can be of no sort of use to him; we bring him nothing, and yet he desires to have us, and expends upon us so much money! But stay, I remember I have indeed something for him—I mean my half-burnt Bible. Will he accept of it, I wonder? Well, we shall see. Tomorrow we proceed by Wittemberg to Potsdam, where the king is at present residing. May God protect thee!”

“Berlin, 2nd May, 1732.

“Praise be to God! The fulfilment of his word is continually more gloriously displayed towards us. ‘Kings shall be thy guardians,’ it says, and they are so. ‘The Lord hath appointed his angels over thee, that they may guard thee in all thy ways;’ and they have done so. ‘Go from thy land and thy kinsfolk, and out of thy father’s house, into a land which I will show thee.’ It is fortunate for us that we have followed his word; his blessing evidently attends us. Ah, Barbara, nothing would be wanting to complete my happiness, if thou and my dear child and our parents were with me. Fortunately I do not write this myself; for my flowing tears would blot out every letter. However, I will not be ungrateful, for what God does is for the best. I will therefore briefly relate to thee all that has befallen us. But I had nearly forgotten, from my excessive joy, to tell thee what happened between Halle and Potsdam. Before we were permitted to enter Potsdam, a surgeon came to examine us at the gate, to ascertain if there were any fever or infectious malady amongst us. As there was nothing of the kind, the clergy, the universities, and the children of the orphan school, came for us, and singing spiritual songs all the way, conducted us to the royal gardens. On all sides were luxuriant trees in full blossom. In one of the broad walks we were made to stand in an extended long line. Then a numerous retinue of noblemen and gentlemen approached us. My eyes were quite dazzled, so much did their dresses shine and glitter in the sun. But when at last a gentleman stepped forward, and the people informed us that he was the king, I anxiously listened, in order that I might not lose a word that he uttered. We saluted him with great respect, but not upon our knees. I will now describe to thee this great king, the sovereign of millions of Christians. His appearance was by no means awful or terrible; on the contrary, rather benevolent and very affable, for he conversed with us just as we do amongst ourselves, without the least pride. He wore a dark blue frock coat, on which sparkled only a single star of a very small size; under his surtout appeared a waistcoat the colour of red tiles, edged with a small gold band, snow-white trousers, and high polished black boots. Upon his head rested a small three-cornered cap, bordered with white swansdown, and at his left side hung a small rapier. In short, a nobler-looking king can nowhere be found. He first took notice of a youth of fourteen years of age, who had forsaken his Catholic parents for the sake of the gospel, and asked him how he could do so. But the latter readily answered, ‘He that loveth father or mother more than me, is not worthy of me.’ Then the king asked him what he now intended to do, and who would take care of him. ‘My father and mother have forsaken me,’ replied the boy, ‘but the Lord taketh me in.’

“The king smiled kindly, as he placed his hand on the boy’s head. I now took heart, and offered this gracious prince the burnt Bible as a memorial of us poor people, who had nothing else to present. On his

accepting it, I informed him of the circumstances through which it came in that condition. He listened attentively to me, and then ordered the book to be carried into his library. I now also entreated him to employ his influence in behalf of poor Manlicken and the other prisoners, and I did not forget your right to the Schüppelhof, of which I gave him the deed of gift. I cannot now understand how I could have had so much courage as to speak to him; but he was very affable, and he assured me that I should soon hear from him, and that he would not forget me.

“We were now led to table, or rather to a number of tables, in the midst of the garden, and what a magnificent dinner was provided! I hope that we may not be spoiled, so as no longer to relish God’s gifts of bread and water; we have now so much beer and wine, and meat of all kinds, sent for our consumption. We had also rich presents from the king, queen, and their officers. After our meal, we knelt down to say grace, and the officers themselves knelt down with us. On our taking leave, the good king once more assured us of his favour, with these words: ‘Ye shall prosper, my children; ye shall prosper with me.’ We could only answer by tears of joy and the hearty cry of, ‘May God reward thee, sire! May God bless and reward thee!’

“We then proceeded to Berlin. And I must now try and recollect all that occurred, that I may omit nothing. At the Schaaf Bridge we were met by the clergy and all the public schools. Campo, the pastor, addressed us in a discourse which had for a text the words, ‘The Lord bless you more and more, you and your children.’ After this fifty New Testaments were distributed amongst us. Rejoice, Barbara; at home God’s word was taken from us, and here it is brought to us! We entered the city in the following order: first, our commissary on horseback; next the scholars, two and two; then twelve candidates for orders: with as many clergymen, two of them on horseback; behind them came the two candidates who had accompanied us from Halle; then followed our children, then the women, and lastly, all the men. The procession was closed by twenty-three waggons containing our effects and the poor sick people. Our children, with their weak voices, began to sing, ‘My God I will not leave,’ in which they were joined by the trembling accents of the feeble and aged, commingled with the powerful strains of the men. The melody sounded afar off. While we, sunburnt by our long journey, in our foreign dresses, were walking piously along, the women, with their young children supported or borne in their arms, the old men and women supporting themselves by their walking-staves, we passed through walls of people, men, women, and children, all deeply affected, as also were we at their charity and sympathy. ‘These cannot be rebels, as the Archbishop of Salzburg declares they are,’ we heard said on all sides. We were led through the royal gardens, in order that the children of the monarch and the nobility might see us. And they also looked upon us with kind compassion, and many turned aside to wipe the tears from their eyes. We stopped before the Königsthor, or royal gate, where we were supplied with quartering billets, and there the Pastor Schönemann welcomed us with a speech in verse, of which, however, I only recollect the beginning—

“‘Be the word of welcome spoken!
Lo! the true cause shall prevail!
Ye the Pope’s dire yoke have broken,
Canaan’s blessings shall not fail!’

We still remain here, and are constantly receiving innumerable kindnesses from Christians and Jews. Even a Catholic soldier who was standing sentry on the long

bridge of Schildwach gave a man of Salzburg three-pence, with these words: 'It is not our Lord God, but only the priests, who occasion your misery.' And now, Barbara, I must conclude my letter; my heart is well-nigh breaking both with joy and melancholy. Come to me speedily. Thou canst not miss the way; any child will show thee the road we have hitherto taken and are still to take. Salute mother Catherine, and kiss my son for me. May the Lord preserve thee safe in body and in soul! Amen.

"Thy rejoicing, and, at the same time, sorrowing
"HANS."

"SOMETHING WRONG WITH THE GAS!"

THERE are very few housekeepers, who, burning gas in their dwellings, are not startled at times with the conviction that something or other in connection with it is not as it should be. For our household gas, whatever may be the cause, indulges in strange vagaries in the course of a year. Now it sings like the kettle on the hob, now it is heard purring like the cat on the rug, and anon it blows a very small trumpet with a wheezy kind of note. At other times it takes to winking and blinking in a most disagreeable manner, as though the several burners were exchanging signals and concocting some mischief together. If it goes out gradually, like a candle burning down in the socket, we know what that means, though we don't like it. When this happens it is always on a Saturday night, and the reason is that the gas at the factory runs short, owing to the immense consumption that takes place in the Saturday night shops and markets, especially in winter, when days are foggy and lights are kindled early.

We had just got to sleep the other night, when we were woke up by a hasty tapping at the door. "Who's there? what's the matter?" we bawl out, only half aroused. "Oh, sir," responds the terrified damsel, "please sir, there's something wrong with the gas, I smell it so plain in my room." We leap out of bed, of course, seizing the night-light, and in another minute are travelling down-stairs, sufficiently alarmed to be wide awake. We sniff and sniff at every step, endeavouring yet fearing to detect the vile odour. Whew! there it is, sure enough!—the girl is right, there *is* something wrong with the gas. What and where can it be? As we descend, the odour grows almost overpowering, and we have only to follow the information of our nose to be well aware that the kitchen is the centre of the grievance. We are not so foolish as to carry the light into the kitchen; so blowing that out, we grope our way in spite of the nuisance, and, throwing open the windows and garden-door, get a brisk draught through the place. A few minutes suffice to expel the mass of the gas, and then rekindling the light we discover at once the cause of the alarm. The kitchen burner, though looped up against the low ceiling, is turned full on, and the gas has been escaping for the last three or four hours; but for the hateful yet admonitory odour, there would certainly have been a blow up. Jemima, who by this time has dressed herself and come down, declares positively that she turned off her gas before going to bed: and so doubtless she did, but in looping up the pipe she *must* have inadvertently turned it on again.

One evening lately, as we stood at the window, the young lady next door rushed suddenly out, and made a frantic rush at our knocker with a series of irregular and convulsive bangs. Seeing that something was amiss,

we opened the door before the performance was half finished. "Oh! Mr. —," gasps out the fair apparition, "there is something wrong with our gas, and mamma is ill, and the servant is out on messages, will you step in kindly and see what's the matter?" Such a request must be obeyed, and we of course return with the young lady. We smell the gas the moment we enter. The escape is from the hall light, which is turned on and off by a tap placed low down, to save the trouble of mounting to the lamp. Some one in reaching hat, stick, or umbrella from the clothes-pegs on the wall, has accidentally turned it on, and hence the fright of the ladies. The invalid mamma, who is in a low nervous state, can hardly be reassured when the mischief is repaired, and is hardly prevented from sending for a policeman, who, she has a vague idea, can alone set the matter perfectly right.

Not very long since, we formed one of a convivial party assembled to welcome the return of a young midshipman after an absence of several years. Dinner came off at half-past seven, and a most hospitable spread there was, under the brilliant light of a huge cut-glass gasalier. About sixteen of us had encircled the table, and were engaged in the deliberate discussion of the first course, flavoured at intervals by a gentle semi-witticism from friend Bolter, when I saw by an accidental glance at Miss Spinster, my *vis-d-vis*, that something was not quite as it should be; she had laid down her knife and fork and thrown back her head; the next moment other ladies were following her example, and I was wondering what it could mean, when a gush of that unmistakable odour from the gaspipe invaded the savour of the viands, and at that precise instant the hostess, with a face of terror, screamed out, "Oh dear! there's something wrong with the gas!" Bolter, who is up to everything, and whose presence of mind is marvellous, was on his legs in a moment, and with an "Allow me, madam," had left the room, and was plunging down towards the nether regions. We heard the squall of cook as he dashed into the kitchen, followed by the guttural tones of Biggins the greengrocer, who had been enlisted for the nonce to wait at table; and then, as we shrank in disgust from the increasing mal-odour, we could hear a lumbering in the cellar beneath us, and the solemn voice of Bolter, like that of the Ghost in "Hamlet," burrowing its way, as it were, beneath the ground. The situation grew tragic, the lights began to burn blue, and as we held our breath and our noses, suddenly went out, and we were left in total darkness, only that a few red rays gleamed from the fire at the end of the room. While the ladies, quitting their seats, huddled together in a corner, the gentlemen threw open the window-shutters and the windows, and as the air rushed in and the gas rushed out, we got a little welcome relief. Then Bolter came in with a candle—an awful figure he presented, with his hands, face, and shirt-front black as soot; but we hailed him as a benefactor, knowing that by turning off the gas at the meter, as he had done, he had saved us from a blow up. When the cause of the mischief came to be investigated, it was found that cook, in her haste, had crushed one of the service pipes in the cellar, causing a rent in it several inches in length. We need not dwell on the sequences of that unfortunate mishap, but it shows how the pipes should always be protected from such accidents.

Some time ago, when sleeping at the house of a friend in the city, we were shaken out of sleep and almost out of bed, shortly after five o'clock of a winter's morning, by a crash like that of a twelve-inch shell, which seemed to shatter everything around. Several

of the window-panes flew in fragments into the room, and of the rest not one remained unbroken. Venturing at length to the window to see what has happened, we can discern through the semi-darkness (for most of the street lamps have been extinguished by the shock) a crowd gathering around the front of the "Star and Banner," some forty paces down the street on the opposite side of the way. It is no use getting into bed again, with the cold air and fog for bed-fellows; so we dress; and in a few minutes mingle with the policemen, cabmen, and early birds, who make up the crowd. It is a scene of fearful violence that we have come to witness. The entire basement-front of the "Star and Banner" is blown out—plate-glass, wainscoting, ponderous shutters, pediment at top, and a good part of the brickwork at bottom—and all hurled, like a shot from a gun, clean across the wide road against the opposite houses. The dwellings on either side are in a condition about as bad, their shop-fronts and shutters being smashed to ruin, while of the tall houses opposite there is not one for forty yards in either direction that can show a whole pane of glass—the sashes of those fronting the shock presenting the appearance of having never been glazed at all. The roadway, meanwhile, for some distance, is covered with a species of glass gravel, every blown-out pane being crushed into minute particles. The worst part of the spectacle is poor "Boots," of the "Star," who has been sent flying across the road, with the rest of the wreck, and whom, as he lies stunned and bleeding, the policemen are preparing to carry on a stretcher to the hospital. The damage in this case amounted to several thousand pounds, and the cause of it all was the drunken recklessness of a gang of London "lambes." They were carousing at the bar up to twelve o'clock the night before, and would not go away when the landlord bade them. To get rid of them he turned off the gas; in revenge, the scamps, ere they groped their way out, turned it on again in half-a-dozen places. The bar, shut off from the house, became filled with gas in the course of the night, and when poor "Boots" came down with his candle in the morning, to light the fire and clean up, he must have been blown into the street before he was aware of his danger.

Escape of gas often happens from children playing with the jets. We have known a country servant, on her first introduction to a gas-lit bedroom, get rid of the light by blowing it out. Another turned the hand round, but turned it back again after the light was out. If the main pipe is turned off at night, there is always risk of some jet in the rooms being forgotten, and the gas escaping when the main is turned on next evening.

We have known various explosions, the source of which could never be traced. Once the contents of a whole conservatory, flowers, pots, plants, shrubs, and a miniature waterfall under the patronage of a plaster Psyche, all came tumbling into the street in the middle of the day, propelled by a blast of ignited gas, no one knew how or why. Some years ago, while rustivating in a western county, we were ourselves nearly knocked down by the contents of a barber's shop window: blocks, fronts, wigs, pomatum, soap, scent-bottles, together with a couple of wax figures, all came out with a sudden flash and bang, depositing themselves in the mud of the road, to the intense amazement and chagrin of the proprietor, who declared that he had not the slightest conception of the cause.

Perhaps there is no better illustration of the old maxim, "Familiarity breeds contempt," than is afforded by the frequency of domestic gas explosions, and the little importance the public attaches to them. If we

had been told when the use of gas in dwellings was first proposed, that there would be hundreds of explosions annually in London alone, and had believed what was told us, it is questionable whether housekeepers would not have risen in a body against it, and kept it outside their walls; but now, having grown up, hand to hand as it were with the combustible element, we take it for granted that it is completely under our control, and trust ourselves without misgivings to the chapter of accidents. When any serious case occurs in our immediate neighbourhood, we are apt to fortify ourselves with the determination to be on our guard, and for a time, perhaps, we don't go to bed until we have shut the gas out of the house; but we soon relax our vigilance and cease to think about it. It would be but common prudence, seeing the real danger that is run, to revise our gas fittings at regular intervals, without waiting for the warning odour that attends an escape, and which may come, as we have shown above, at the most inopportune moment. It is advisable also, on moving into a house where gas has been burned, to have the whole apparatus first examined and certified by a practical gasfitter. Out-going tenants are apt to quarrel with the landlord on the subject of piping they have been to the expense of laying; the landlord will not buy it of them, but will force them to make good any damage occasioned in removing it—so it happens that out of revenge they will often render the pipes useless by cutting or piercing them, to the annoyance and peril of the incoming tenant.

There is one fact noticeable in connection with gas, that shows there is something always wrong somewhere. We allude to the prodigious waste that takes place. Of all the gas made at the factory, and passing through the factory meter, very little over one-half is ultimately paid for by consumers. It is known that an enormous waste takes place from the large underground pipes, the junctions of which, on the English system, are rarely, if ever, perfectly gas-tight. The extent of loss from this source can only be guessed; but one needs only to pause a moment at any excavation in the streets where the gas mains are laid bare, to be convinced that it must be very large, looking to the hundreds of miles of large iron pipes laid down in London streets. Much is also lost by destructive fires, when the service pipes are melted, and quantities burned to waste before it can be turned off. Again, persons who do not burn by meter, but by contract, are apt to have their timepieces at fault, and keep their lights going long after they should be extinguished—though this offence is not so common as it was, the practice of burning by meter being now enforced in London, and common in other places. The last and most disgraceful source of loss that occurs to us is that arising from the tricks of dishonest consumers: every now and then some mean-souled knave will exercise his ingenuity by inserting a small pipe into the branch pipe from the main, *on the wrong side of the meter*, thus drawing off a half, or it may be more, of his supply before it enters the meter, so that it escapes being registered and set down in the quarterly account. We have known tradesmen in thriving circumstances, and apparently respectable, to be guilty of this roguery—and have known them, also, to come down with a swingeing solatium to the gas company to prevent their ingenuity from being made public.

In conclusion, let us remind our friends who burn gas, that since its introduction into dwellings, which dates about forty-five years back, the number of destructive fires in London, in proportion to the population, has more than doubled. This consideration

ought to be an inducement to constant watchfulness and precaution, and should urge us to instant investigation whenever the alarm is sounded of, "Something wrong with the gas!"

THE EXPLORER'S CHRISTMAS IN AUSTRALIA.

BY T. BAINES, F.R.G.S.

It would be superfluous to inform the readers of the "Leisure Hour" that Christmas in the southern hemisphere is a season of warmth, of sunshine, and of open-air enjoyment. Of course, throughout all Christendom the occasion is the same. I have heard the magnificent hymn of the nativity sung in the churches of South Africa as it is at home, and I have heard also, in the island of Timor, two hundred Malay children mingling their voices with those of the Dutch colonists in the Angels' Song. But in the terrestrial festivities of the season in such regions the fireside enjoyments of England have no place. Friends and relatives interchange short visits to say a few words of kindly greeting, and picnic parties, in the lightest costume, escape from the heated town to spend the rest of the day in the coolest and shadiest groves.

My own reminiscences of Christmas-day recall many a wild scene from the stormy coasts of England to the populous towns and solitary deserts of Africa or Australia, in peace or war, in plenty or in starvation. Of these I have selected the Christmas of 1855 as the subject of my present sketch. In the early part of that year I had been appointed artist to an expedition to explore the north-west parts of Australia, and had proceeded to Sydney to join Mr. Augustus Charles Gregory, the commander. Two vessels were engaged: the barque *Monarch*, which took on board 50 horses and 150 or 200 sheep at Moreton Bay, and left us at the mouth of the Victoria River, and the *Tom Tough* schooner, which carried the sheep up the river, while Mr. Gregory crossed the country with the horses to the spot chosen as our main camp. Our little schooner took the ground in going up, and nearly became a wreck; but after twenty-seven days' beating about on the sandbanks was brought up to the main camp, and was there substantially, though only partially, repaired by the skill and industry of Captain Gourlay. A wharf was built alongside her of her iron pig ballast, and the remains of this will for many years to come indicate the locality of our camp.

It was in truth a pretty little spot, about eighty miles from the river mouth, beyond the rise and fall of the tide, although the water was brackish several miles higher, except in the rainy season, when the floods poured down as if to dispute the empire of the ocean. The mangroves which fringe the borders of the salt rivers, and which, in fact, perform an important part in the reclamation of land from the sea, by converting newly-formed shoals into soil fit to bear a higher class of vegetation, had not yet entirely ceased, but seemed mingling with and giving place to trees more proper to a fresh-water stream. Gum-trees of various kinds formed park-like groves upon the higher banks—some with that peculiar smooth white bark and graceful turn of limb, that caused our excellent doctor, the late J. R. Elsey, to think it so like a beautiful and well-turned arm, that he always experienced a desire to feel its pulse.

A small but clear and permanent spring, under a couple of gouty-stem trees—a kind of Baobab, named after our commander *Adansonia Gregorii*—supplied water enough for our own use. The surviving horses were driven further afield to graze and drink, and our

sheep, by the disaster of the river voyage, had been reduced to about forty. Rough poles with forks left on them, for the support of roof-trees or rafters, were cut as we cleared the ground, and a substantial store and dwelling-house was formed. The roof was stoutly thatched, and the walls were in a great measure formed of the bottoms, the sides, and wheels of our drays, most of the draught horses being unfortunately in the list of those that had perished. The oven was built under the large trees near the spring, and the forge under a similar group at a little distance. The dense foliage gave abundant shade, while the numerous white blossoms relieved its verdure; and the acid pulp of the succeeding fruit, boiled with sugar, formed a grateful medicine to the poor seamen when, from the destruction of their provisions, scurvy began to attack them. The young shoots of the wild vine also were gathered, and the negro who served as cook gave us them under the title of rhubarb pies.

The officers and men built houses, huts, or bowers, according to their taste, covering them with sheets of bark or thatch, or with cool, fresh leafy branches, gathered every two or three days. The three sides not protected by the river were surrounded by a mound and trench, within which it was a standing order that no native was to be admitted. For though, as my sketch shows, we had occasional friendly intercourse with them, adding to the snakes or rats, or other small animals they cooked for themselves, gifts of bread or fat pork from our own stores, they were exceedingly capricious, and Mr. Gregory wisely judged it best to reduce the chance of any quarrel with our men as much as possible.

Alligators and fish of various kinds abounded in the river; lizards up to six feet long, cranes and storks, pigeons, parrots, and cockatoos, black, white, and rose-coloured, abounded in the woods, all serving as welcome additions to our fare. On an adjoining tributary, which I visited when searching for horses, and which Mr. Gregory named after me "The Baines River," I found the trees so thickly crowded with perching ducks as to convey the idea of the densest possible foliage. The rainy season commenced in November, and consequently at Christmas the country was covered with its richest verdure.

The labours of an explorer are neither few nor light. Even though he bears the rank of a scientific officer, he must not only mingle in the various occupations of the men, but in cases of emergency must take upon himself the most laborious part, teaching the unskilful, encouraging the industrious, and shaming the indolent or desponding by his example. There are times when even the rest of the Sabbath is disturbed by accidents unknown at home. But this is rather the exception than the rule, and most travellers, so far as I have seen, keep it, not merely as a day of rest, but also set apart a portion of it for some form of religious observance.

It was remarked by Leichardt, as well as others, that it was a good thing to let the men look forward to holidays, say on the principal festivals of the Church, or on the birthday of the sovereign, and to make whatever addition is possible to the usual fare. I believe he celebrated the birthday of the King of Prussia by mixing a little fat in his damper. And I have given a handful of raisins to an honest, hardworking fellow who was desirous of doing nothing all day in memory of St. Patrick.

On Christmas-day, 1855, although our meal was frugal, it was still not scanty. The regulation plum-pudding graced our board; the remnant of our little

flock furnished us with fresh meat, a bottle of wine, by permission of the doctor, enabled us to drink the health of absent friends; and tea and coffee, with sugar, but without milk, and skilfully-made light cakes, followed;

which wealthy friends or elevated position confer, he succeeded in reaching an eminence in the world of art which has gained renown, not only for himself, but for his country.

CHRISTMAS-DAY IN NORTH-WEST AUSTRALIA.

and the men enjoyed themselves in reading or other quiet amusements.

I am not now giving a history of our expedition, yet I think the reader will feel sufficient interest in it to be glad to hear that Mr. Gregory explored the whole course of the Victoria River, and traced another stream, which he called Sturt's Creek, 300 miles farther into the interior—that he discovered in the vicinity of the Victoria three million acres of good pasture land, and that on his return he was rewarded by the reception of the gold medal of the Royal Geographical Society.

THORWALDSEN THE SCULPTOR.

THE recent publication in Paris of a life of this celebrated Danish sculptor,* affords a good opportunity of laying before our readers some points of his history most worthy of note. Possessing none of the advantages

Albert Bartholomew Thorwaldsen was born in Copenhagen, November 19th, 1770. His father was a native of Iceland, to which his paternal ancestors also belonged. His mother was the daughter of a Danish pastor. His childhood was unmarked by anything striking, except the delight which it gave him to be allowed to go to the workshop of his father, who was engaged as carver of figure-heads in the royal dockyard at Copenhagen. To assist in this work, as soon as he could handle the requisite tools, was a great source of pleasure to him.

In accordance with the privilege enjoyed by the children of the Government *employés*, Thorwaldsen was sent to a public school at the age of eleven. He does not appear to have made much progress with his learning, but his talent for drawing and art attracted the notice of Abildgaard, the historical painter, who, perceiving his capability of becoming something better than a ship-carver, sent him to the Academy, where he rapidly gained distinction, and took the best prizes. His earliest works were characterised by a certain amplitude and magnificence of form, but there was

* By M. Eugène Plon, with illustrations of his works.

ambiguity in the design, and affectation and want of freedom in the positions.

As a student, Thorwaldsen was very quiet and retiring. He rarely spoke, and never laughed. There was an air of melancholy about him, and a depth of mournfulness in his clear blue eyes, which, added to delicate health and an ignorance of everything unconnected with art, gave little promise that he would make his way in the world.

But though the young student was so modest and bashful, his works spoke for him; and through the patronage of Count Reventlow, he was sent to Rome with an annual allowance of four hundred thalers from the Academy. As his health and poverty would not permit a journey by land, he was sent in a Danish frigate, whose figure-head he had perhaps in his boyish days helped to carve. After a tedious voyage, he reached Rome in the beginning of the year 1797, and was astonished at the world of beauty which burst upon his view. To use his own expression, "the snow melted out of his eyes," and he saw art in such a different light as to lose all confidence in his own performances. All his ideas were changed, and with that industrious perseverance which was such an important element of his ultimate success, he devoted himself almost exclusively for five years to the study of the antique, of which he found such wonderful specimens in Rome. He renewed the acquaintance which he had formed with Carstens, one of the most remarkable painters of his time, whose influence over him while in the Academy at Copenhagen had been very great. Carstens took a great interest in the young artist, and gave him much help in his studies.

His principal friend in Rome was Zoega, the Danish archaeologist, to whom he had been warmly recommended. He gave Thorwaldsen a cordial reception, but blamed the Academy, in a private letter, for sending "such raw and ignorant people to Rome." The four years of his residence with Zoega so improved him, that from being merely a clever sculptor he became a master, and gave a direction to all the art of his time. Zoega criticised his performances very carefully, and pointed out faults in conception or execution in the most unsparing way. Eventually, however, Thorwaldsen appears to have chafed under the well-meant but uncompromising criticism of Zoega, and withdrew himself from his protection.

As a proof of the progress which he had made in Rome, Thorwaldsen modelled in plaster a life-sized statue of "Jason," which obtained the gold medal, but otherwise attracted so little attention, that he broke it up. He acquired the coveted popularity through a colossal figure of the hero, which not only drew forth universal acclamation, but led Canova, then living in Rome, to exclaim, "This work is one of a new and magnificent style of art." But notwithstanding this praise, no one seemed inclined to order a copy of it in marble, and it very nearly shared the fate of its predecessor. Thorwaldsen had exceeded the length of residence permitted by the Danish Academy, and had also exhausted his private resources. He waited week after week, and became at last thoroughly sick at heart through hope deferred. Fame, which had seemed to be approaching him with rapid strides, had again disappeared, and he decided to leave Italy. The poor artist had packed his boxes; his furniture and all superfluous articles had been sold; and he was on the point of leaving Rome, when his compatriot and fellow-student, Hagemann, with whom he had intended to travel to Berlin, found that in consequence of some informality

in their passports, it would not be possible for them to leave till the next day.

This apparently unimportant accident was the turning-point in Thorwaldsen's career. The day's delay changed the current of his future life. A few hours after, he received a visit from Sir Thomas Hope, the rich banker, who wished to see the "Jason." From his extensive knowledge of art, he was able to appreciate the beauty of the statue, the magnificence of which had struck him at the first glance. He asked what it would cost in marble. "Six hundred zechins," was the answer of the artist, whose eyes were lighted up once more by a gleam of hope. "That is far too little," replied the munificent Englishman, "you must have at least eight hundred," and gave him the marble, that he might begin without loss of time.

Thorwaldsen's life in Rome now entered a new phase. Instead of being a stipendiary of the Danish Academy, he enjoyed the position of an independent artist, and a succession of commissions continued to him the good fortune which the generous banker had brought, and which never deserted him. His genius and industry were more and more developed, and his fame increased rapidly.

In 1819, having had a dangerous illness the year before, he returned to Denmark for a brief visit. His reception may be easily imagined. The whole country was proud of him, and honours were showered upon him from every side. He was frequently invited to the royal table, and in order to be able to comply with the rigid etiquette of the Danish Court, was made a privy-councillor. His former companions gave him a very hearty welcome, which he received in a homely and affable way. The only drawback to the pleasure of his return was that his parents were unable to witness his fame, having died shortly after he went to Rome.

Thorwaldsen's visit, though very short, was highly beneficial to the progress of art in Denmark. He received a great number of inquiries as to the best means of promoting artistic taste among the people, which led him to the publication of a work on the subject some time after. But the most important result of his visit was the commission which he received for the decorations of the cathedral of Notre Dame, which had been rebuilt after its destruction during the bombardment by Nelson in 1807. The frieze and the statues executed in consequence of this order are very superior, and are almost the only specimens of religious art which we have from his chisel.

In August of the following year he set out on his return to Rome, visiting several towns on the way. At Warsaw, he took the bust of the Emperor Alexander, and received commissions for the statues of Copernicus and of Prince Poniatowsky. The latter was an equestrian statue in bronze, and was not finished till 1830. We learn with sorrow, not unmixed with disgust, that it was afterwards destroyed by the Russians when quelling the Polish insurrection.

Thorwaldsen subsequently visited Troppau, in Silesia, which was at that time rendered famous by the only event of importance which has occurred in its history—the congress of crowned heads, which met to consider the question of the suppression, by Austria, of the Neapolitan insurrection. The Emperors of Russia and Austria and the King of Prussia were present, and England and France sent ambassadors. Thorwaldsen received such a flattering reception from them, that he prolonged his stay, and went afterwards to Vienna. His residence in the Austrian capital was suddenly terminated by the alarming news from Rome, that

the floor of his studio had given way, causing the destruction of two marble statues and a model in plaster.

On his return to Rome, Thorwaldsen recommenced his labours with untiring energy. His genius and skill appeared to be inexhaustible. He was greatly pleased with the distinguished honour conferred upon him by Cardinal Gonsalvi, who entrusted him with the order for a monument to the deceased Pope Pius VII for St. Peter's. But he was not allowed to enjoy the honour in peace. On all sides there were loud and angry murmurs at a heretic being allowed to execute the statue of a pope for a Catholic cathedral. The death of the cardinal in 1824 gave the envious Roman sculptors renewed courage, especially as the numerous orders which Thorwaldsen had received had caused some delay in the completion of the monument. Their malice seemed about to be rewarded with success, when two events occurred which defeated their designs, and led him to victory.

After the retirement of the painter Canuccini from the presidency of the Academy of San Luca, in Rome, the custom required that a sculptor should be elected to succeed him. Who was more worthy of the honour than Thorwaldsen? Who would confer greater distinction on the Academy than the man whose name was famous throughout Europe? But in spite of his obvious claims to the office, his enemies repeated their objections to him as a Protestant, adding that it was impossible that any one but a Catholic could hold a position which would require his attendance at certain religious festivals.

The matter was laid before Leo XII. "Is there any doubt," asked his Holiness, "that Thorwaldsen is the greatest sculptor living in Rome?" "That cannot be denied," was the reply. "Then there can be very little difficulty about the election. He must be chosen as president. It must, however, be arranged that he shall have opportunities of reporting himself unwell when he finds it necessary." This little "Papal allocution" silenced all opposition, and on the 26th of December, 1825, Thorwaldsen was elected president of the Academy, for the usual period of three years.

The liberal opinions of Leo XII were a good omen of the success of the monument to Pius VII, but he took a more decided step by visiting Thorwaldsen's studio in person, and expressing his approbation of the work, which was in due course completed and finally erected in the year 1831.

Thorwaldsen was an object of attraction to every stranger visiting Rome. Among many other persons of celebrity, Sir Walter Scott obtained an introduction to him. Although so well acquainted with the literature of the north of Europe, Scott could only converse in his own tongue. Thorwaldsen, on his side, had but a very slight knowledge of English, so that the meeting of the two celebrated men was somewhat peculiar. They saluted each other very heartily, but could only give vent to their feelings of pleasure in broken sentences and exclamations, such as "Conocenza—charmé—plaisir—happy—acquaintance—piacere—delighted—heureux." The conversation was necessarily rather brief and scanty; but the two new friends were so pleased with each other, that they shook hands very heartily, and patted one another on the shoulder, and after they had parted, looked at each other as long as possible, nodding in the most familiar way. A simple, unaffected man himself, Thorwaldsen was delighted with all who were frank and open, and therefore felt himself attracted to Scott as soon as he saw him. He could not, on the other hand, fathom the remarkable character of Byron,

and found it quite impossible to understand his misanthropic melancholy.

In the year 1838, at the age of sixty-eight, Thorwaldsen returned to Denmark, not, as twenty years before, to pay a brief visit, but to end his days. The enthusiasm and homage of his countrymen was boundless. No sovereign ever received such touching and brilliant proofs of the love and reverence of his people. The artist was deeply moved. When, on the evening of his arrival in Copenhagen, he stood on the balcony of the academy, and saw the immense crowd below, which burst into shouts of joy at his appearance, he turned and said smilingly to his friend Thiele, "One would imagine that we were in Rome, and that I were the pope, standing in St. Peter's, and pronouncing the blessing 'urbi et orbi!'"

An interrupted succession of festivities so hindered the sculptor in his work, which he had not laid aside, that he found it necessary to retire for six months at a time to the estate of his patroness, the Baroness von Stampé, where, at her request, he executed his own statue, and the bust of Cbhenschlager, the Danish *littérateur*. His diligence and ability were still unimpaired. The only thing which marked the approach of age was the loss of his memory, which, in regard to invitations, led to many amusing mistakes. When the dinner hour arrived, he searched among the papers lying on his table, and took the first of four or five invitations which he found. He soon found it necessary to change a system which led him to give very frequent offence, and adopted the plan of giving all such matters into the charge of a very devoted and intelligent servant, named Wilkens. If he were invited anywhere, he invariably said, "I cannot promise to come; you must ask Wilkens, he will tell you if I am disengaged or not." As Wilkens always accompanied him to and from the houses which he visited, it frequently happened that he was ignorant of where he was going even when already on the way.

Although rather parsimonious, and often suffering from attacks of hypochondria, Thorwaldsen was nevertheless a man of a generous and amiable disposition. The King of Prussia on one occasion ordered a statue from him. "Your Majesty," answered the sculptor, "there is at present one of your Majesty's subjects in Rome more competent than I am to carry out the wishes with which you have deigned to honour me. May I be permitted to recommend him to your royal patronage?" The artist thus introduced to the king was Rudolph Schadow, who was then in very depressed circumstances. His beautiful work, "The Spinning Wheel," was the result of this considerate recommendation.

In the year 1841, Thorwaldsen travelled again through Germany and Switzerland to Rome. He was everywhere received with the highest marks of esteem and respect, and after a short stay in Rome, returned to Copenhagen, where he died of an apoplectic stroke, on the 24th of March, 1844.

Having no relations, he bequeathed his large and valuable collection of statuary and casts to the state, on the condition that a building should be erected for their preservation and exhibition, which was opened in 1846, and has called forth the admiration of all visitors to Copenhagen.

Our space forbids any enumeration of his works. Many of them were so much admired that it was necessary for him to repeat them frequently. His bas-relief of Achilles witnessing the departure of Briseis is worthy of comparison with the best specimens of the antique. The statues of Schiller in Stuttgart and of Gutenberg

in Mayence have been highly praised. His last work, at which he was engaged a few hours before his death, was a statue of Luther.

PEEPS THROUGH LOOPHOLES AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT REDE.

"'Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd."

COWPER.

NO. XII.—CHRISTMAS HERALDS.

It was on a Monday morning, in the last week of November, in the year 1787, that an elderly man of plain, decent appearance, came to the house called Weston Lodge, in the pleasant village of Weston-Underwood, in Buckinghamshire. The lodge was situated close by the road-side, and had been the vicarage house; and, though its present occupant was not a parson, he had done more parson's work than had been accomplished by most men who have not been admitted to holy orders; for he was William Cowper, the poet. A twelvemonth since he had come to that spot from the adjacent village of Olney, where he had lived for twenty years, and where, among many other religious productions, he had written those hymns which have been a comfort and consolation to Christians throughout the world.

Cowper lived there with his dear old friend, Mrs. Unwin,* with whom he had removed from Olney. His fifty-fifth birthday, on November 26, 1786, found him safely housed there, hardly attending to the dark, thick fog that hung around the house on account of the neatness and cosy comfort that reigned within doors. It was one of those days that were the heralds of Christmas, from which the poet of "The Task" knew how to extract so much that was pleasant and profitable; and, whether the days were wet or dry, the house was warm and comfortable.

"There is a man in the kitchen, sir, who desires to speak with you," said the person who acted as butler, footman, and gardener to the two inhabitants of Weston Lodge.

"What sort of a man is he, Sam?" asked his master.

* In the very interesting "Life of John Newton," by the Rev. Josiah Bull, grandson of Cowper's friend, the biographer settles conclusively the often mooted question of the poet's engagement to Mrs. Unwin. Mr. Bull quotes the following passage from Southey, and proves its error by an extract from "Newton's Diary," hitherto unpublished:—"Another cause, however, has been assigned for the return of Mr. Cowper's malady. It has been said that he proposed marriage to Mrs. Unwin; that the proposal was accepted and the time fixed; that prudential considerations were then thought to preponderate against it; and that his mind was overthrown by the anxieties consequent upon such an engagement. This I believe to be utterly unfounded; for that no such engagement was either known or suspected by Mr. Newton I am enabled to assert; and who can suppose that it would have been concealed from him?" This is unquestionably a mistake, although thus strongly put. Nothing, it is obvious, was more natural or becoming than a marriage between two persons thus providentially brought to reside with each other. Nor was there, as is perhaps generally supposed, any great disparity of years between Mr. Cowper and Mrs. Unwin. Now the editor of this volume is able to state that he has again and again heard his father say that Mr. Cowper and Mrs. Unwin were betrothed, and about to be married, when the melancholy return of Mr. Cowper's malady in 1773 prevented the accomplishment of their purpose; and, moreover, that it was Mrs. Unwin herself who made this statement to his grandfather. But what Mr. Newton has said in his unfinished sketch is even still more to the purpose, and must for ever settle this question. We copy from the original before us: "They were congenial spirits, united in the faith and hope of the gospel, and their intimate and growing friendship led them in the course of four or five years to an engagement for marriage, which was well known to me, and to most of their and my friends, and was to have taken place in a few months, but was prevented by the terrible malady which seized him about that time."

"A plain, decent, elderly man, sir, who gives his name as Cox, and says that he has trudged hither all the way from Northampton, desirous to speak with you."

"It must be a pressing matter that thus makes him undertake a walk of some fifteen miles. Show him in, Sam." And Sam presently returned, ushering the decent, elderly man into Cowper's study, which was also the dining-room.

"Pray be seated, sir," said Cowper, with his customary polite and gentle manner; "and let me know for what cause I am indebted for the honour of this visit, paid at the task of so long a walk."

"Sir," said the visitor, taking a seat, and clearing his throat, as though he were in his clerk's desk and about to commence his official duties—"sir, my name is Cox. I am clerk of the parish of All Saints, in Northampton; brother of Mr. Cox, the upholsterer. It is customary for the person in my office to annex to a bill of mortality, which he publishes at Christmas, a copy of verses. You will do me a great favour, sir, if you will supply me with one."

To this, Cowper replied, "Mr. Cox, you have several men of genius in your town; why have you not applied to some of them? There is a namesake of yours in particular, Cox the statuary, who, everybody knows, is a first-rate maker of verses. He, surely, is the man of all the world for your purpose."

"Alas, sir!" replied the Northampton parish clerk, "I have heretofore borrowed help from him; but he is a gentleman of so much reading that the people of our town cannot understand him."

Cowper could not but feel all the force of the compliment implied in this speech, and was almost ready to answer, "My good friend, they may find me unintelligible for the same reason." But, on asking him whether he had walked over to Weston on purpose to implore the assistance of his muse, and on the clerk's assuring him that he had done so, Cowper, as he afterwards testified to his cousin, Lady Hesketh, felt his mortified vanity a little consoled; and, pitying the poor man's distress, which appeared to be considerable, promised to supply him with what he wanted; and Mr. Cox took his leave, with many protestations of gratitude, and was shown out through the kitchen by Sam.

Cowper was not one to forget a promise, especially when it was to give gratuitous help to an inferior in rank and station. He soon wrote nine verses, one of which has made its mark and been often quoted:—

"Like crowded forest-trees we stand
And some are mark'd to fall;
The axe will smite at God's command,
And soon shall smite us all."

And though he headed his verses with a quotation from a Latin author—perhaps to show that he also was a gentleman of much reading, like Mr. Cox the statuary—yet he wound up his stanzas with lines that could be as easily understood by the people of Northampton as any preceding ones in his poem. They were these, and were presumed to be written by the brother of Mr. Cox the upholsterer:—

"So prays your clerk with all his heart,
And, ere he quits his pen,
Begs you for once to take his part
And answer all—Amen!"

This poem was sent off to Northampton by the waggon, which, as Cowper said, was "loaded in part with my effusions in the mortuary style." And he gaily exclaimed, "A fig for poets who write epitaphs upon individuals! I have written one that serves two hundred persons." He wrote five more of these poems to

accompany Mr. Cox's "bills of mortality" for the ensuing years, up to 1793; but in the following year, 1794, the breaking down of his own health prevented him from continuing his accustomed kindness to the parish clerk of All Saints.

Those "bills of mortality," with their copies of verses, were, at that time, among the looked-for heralds of Christmas; and others than parish-clerks were wont to announce the season by a distribution of "A Copy of Christmas Verses," presented to those inhabitants of the town from whom they anticipated the present of a Christmas-box. Postmen and dustmen have done this up to a very recent date; and the watchmen were strenuous upholders of the custom. One of their pieces, of the date 1823, concluded with the following lines:—

"To brighter scenes we now direct our view;
And first, fair ladies, let us turn to you.
May each New Year new joys, new pleasures bring,
And life for you be one delightful spring!
No summer's sun annoy with feverish rays,
No winter chill the evening of your days.
To you, kind sirs, we next our tribute pay:
May smiles and sunshine greet you on your way!
If married, calm and peaceful be your lives;
If single, may you forthwith get you wives!
Thus, whether male or female, old or young,
Or wed or single, be this burden sung:
Long may you live to hear, and we to call,
A happy Christmas and New Year to all!"

The heralds of Christmas are very numerous, and appear in very different shapes. We have only to glance down the advertising columns of the newspapers, any time after Advent has begun, to see in those manifold announcements of creature comforts, luxuries, and redundancies with which our nation of shopkeepers usher in the festive season, what are considered by them and their customers to be the heralds of Christmas. One advertiser is disposed to think that a guinea hamper of cheap wines will be found an acceptable herald; another changes the hamper of wine to a chest of tea; another to a load of coals; another to a box of toys for a Christmas-tree; another to a case of oranges, and raisins, and dried fruit, with "sugar and spice and all that's nice." Then there are the signs of preparation at the poulterers' and butchers', at the grocers' and fishmongers'; and the key-note sounded for the Christmas cheer by the Smithfield Club Cattle-show. There are also the "breakings-up" of school, and the beginning of the holidays, the sure and pleasant heralds of Christmas to all the "happy families" throughout the land. And there are also the waits, whose early minstrelsy is heard a week or two in advance of Christmas. But it is not of these Christmas heralds that I would speak, but of one or two lesser-known varieties, only to be met with in such sequestered country villages as our *Minima Parva*.

Yet, as I have just mentioned the waits, I will make an exception for an exceptional character, and briefly speak of one herald of Christmas, whose musical perambulations as "a wait" were confined to a manufacturing town. He has been dead now some sixteen years; but I well remember him through many years, and from an early age. I have forgotten his surname, but he always went by the name of "Blind William," for he was quite blind. Yet, notwithstanding that "total eclipse" of his vision, he would daily leave his home at Kidderminster, make his way unattended through two streets, turn up to the parish church (Richard Baxter's church), unlock the gates of the churchyard and tower, and climb the staircase to the belfry, where he rang the five o'clock morning bell, and then would return home, to revisit the church in the

evening, in order to ring the eight o'clock curfew bell. This bell on a certain night in the year was prolonged for one hour, a sum of money having been left for that purpose as a thank-offering to God, by a person who, on his way home from Bridgenorth fair, would have fallen over a rock, had not the sound of the Kidderminster curfew warned him to retrace his steps. Many times have I seen Blind William, with upturned sightless gaze and smiling face, steadily pursuing his solitary walk to and from his daily occupation. It was his sole business, except at Christmas; and he was the first herald of the season. Like many others similarly afflicted, he had an extraordinary ear and taste for music, and could quickly reproduce on his violin any tune that he had heard. On the midnight after Advent Sunday he began his annual task as a Christmas herald, by going through the streets, playing upon his violin a hymn tune, at the end of which he said, "I wish you a merry Christmas and a happy new year;" and then passed on to another street. This he continued nightly through the Advent weeks, and, in the Christmas week, came round for his well-earned Christmas-box. The female relative who kept house for him accompanied him on these visits, and on his nightly rounds as a Christmas "wait"; and often, as a boy, have I lain awake listening to Blind William's violin performance, and his cheery salutation. In the winter season he always carried a lantern when he went to and from the church; this was in order to prevent careless people, who were blessed with sight, from running against him. Blind William was the earliest herald of Christmas known to me in my youthful days.

But I would speak now of some heralds of Christmas to be met with in those thousands of sequestered villages and hamlets—like our *Minima Parva*—that are scattered broadcast over the fair soil of England. There are our mistletoe-gatherers; for that parasite grows so freely in this parish—in our orchards and on the American poplars and other trees in our hedgerows—that it becomes an important article of commerce; quite as much so as is our watercress, of which we send many tons' weight up to the London markets. We also send mistletoe and holly to the "great Babel"; and I dare say that we contributed our share to those remarkable statistics so elaborately made by Mr. Henry Mayhew, in 1851. He reckoned that there were, at that time, nearly 250,000 "branches" of holly sold by costermongers, for £738. The choicely-berried sprays for the crowning glory of the plum-pudding were valued at £200. The fear then expressed by a gardener as to a "No Popery" cry depreciating the demand for holly, may possibly affect its sale this present Christmas. "Why," he said, "properly to 'Christmas' St. Paul's would take £50 at least, or nearer £100. I hope there'll be no 'No Popery' nonsense against Christmasing this year. I'm always sorry when anything of that kind's afloat, because it's frequently a hindrance to business." Mr. Mayhew reckoned the London sale of mistletoe at £702. It was double the price of holly, which was often made to do duty for "the kissing-bush"; and half-a-crown was a not uncommon price for a handsome mistletoe bough. The greater portion of the "Christmas" is bought by the costers in the market to retail in the streets and suburbs of the metropolis; and their stock has to be laid in at least a fortnight before Christmas. Consequently it happens that here, in *Minima Parva*, as in other places, the holly and mistletoe is gathered when December has not half completed its days. Our "merry men" cannot afford, as did those in Sir Walter Scott's poem, to wait till Christmas-eve before they go to the

wood "to gather in the mistletoe"; for, when that evening comes, the mystic bough will have passed through many hands, and have travelled many miles. Its gathering gives profitable employment to many of our rural population, both young and old; and when I see two cottage lads pass up the lane with a stick over their shoulders, from which hang boughs of mistletoe and branches of berried holly, although they somewhat remind me of the pictures of Israelitish spies with the grapes of the Promised Land, yet I know them to be the heralds of Christmas, and therefore the harbingers of the season of glad tidings.

We have another Christmas herald in the shape of the country carol-seller, whose vocation begins with December. To our rural population he is just as much a harbinger of Christmas-tide as the may-bloom is of spring or the swallow of summer. The poet Gay said that the townspeople could "judge the festival of Christmas near" by rosemary and bays being "bawled in frequent cries through all the town"; and the country folks are reminded of the oncoming of the festal time by carols being bawled through the village streets. For the modern Autolycus who, in December, takes up the trade of a carol-seller, not only offers his wares for sale unto those who, like Mopsa, the shepherdess, dearly "love a ballad in print," but can also "bear his part" in singing it; "'tis his occupation" so to do; and, like Autolycus, he often sets his carol "to a very doleful tune." Nevertheless it is music to the rustic ear; and the carol-seller is doubly welcome because he is also a carol-singer.

The country carol-seller disdains to offer novelties of song. He knows his customers, and is aware that they will give the preference to verses, the rudeness of whose jingles and the roughness of whose metre are all smoothed and mellowed to them by time and long familiar usage. And so he gives them their choice between such carols as "God rest you, merry gentlemen," "Behold the grace appears," "I saw three ships come sailing by," "Now thrice welcome Christmas, that brings us good cheer," "When Christ was born of Mary free," "Lullaby, my baby, what meanest thou to cry," "A glorious star from heaven appeared," "On Christmas night all Christians sing," or, of more recent origin, "While shepherds watched their flocks by night," "High let us swell our tuneful notes," and "Hark, the herald angels sing." All these are sealed either with the stamp of antiquity or of public approval, at any rate in rural districts; and the country carol-seller selects his wares judiciously, and confidently offers to the rustic ploughman the Christmas carol that he would not place before a town mechanic. The cuts also must be old-fashioned. Hone once advised a printer to get some new designs, and the answer was, that the people wouldn't think the carols genuine if the pictures were modern. So we leave him singing to his small audience of village children—

"The shepherds at those tidings
Rejoiced much in mind;
They left their flocks a-feeding,
In tempest, storm, and wind,
And went to Bethlehem straightway,
The heavenly Babe to find."
* * * * *

The end of the year has now brought my monthly essays to a close, and I have thought that I could not more appropriately conclude them than by taking my last "Peep through Loopholes" at those Christmas heralds who proclaim the approach of the glad season that brought Peace on Earth, Good-will to Man.

TRIPLE RAINBOWS.

To the Editor of the LEISURE HOUR.

SIR,—I enclose a copy of a very short paper by Bishop Mant, descriptive of the phenomenon of triple rainbows, described and illustrated in No. 826 of the LEISURE HOUR, my reason being that it supplies the explanation "left open for the consideration of meteorologists."

The bishop's paper is accompanied by a coloured engraving of the three bows, their position being very similar to that you have reproduced from the "Encyclopædia Metropolitana," as seen by Dr. Halley at Chester. It is worthy of notice that the point on which the bishop evidently felt doubt, namely, that the relative position of the three bows remained unchanged, had on the previous occasion been noted by Halley, thus supplying the missing link in the verification of the bishop's explanation. Your readers will notice that there is the requisite water surface in each case. "In the North Seas" there would probably be more or less, "at Belfast" there is the Lough, "at Chester" the estuary of the Dee, and lastly, "amid the isles of Greece" there could be no scarcity of water, and the mirror was evidently good, as "the yacht was becalmed and perfectly steady." From all the evidence there cannot be a doubt that the extraordinary bow described by your correspondent, was occasioned by an image of the sun reflected from the surface of water. I may add that Dr. Scoresby (in "Edinburgh New Philosophical Journal," vol. II. p. 235) described some appearances of this kind, observed in the North Seas, but these were much more imperfect than that described by Bishop Mant. G. J. SYMONS.

From the Transactions of the Royal Irish Academy, Vol. XV., 1828. A PHENOMENON OF THE RAINBOW, OBSERVED BY R. MANT, D.D., M.R.I.A., LORD BISHOP OF DOWN AND CONNOR, NOV. 14TH, 1826.

"This phenomenon was observed at the See House, near Belfast, between 3 and 4 p.m. on Tuesday, November 14, 1826. It remained till the setting of the sun. The colours of each bow were brilliant, but the centre one was the least so. It is not known how long it was visible, but it must have been at least ten minutes. This phenomenon appears to afford an interesting illustration of the theory of the rainbow.

"It cannot be doubted that the extraordinary, or centre bow, was occasioned by an image of the sun reflected from the surface of water (probably the Lough of Belfast). The description and figure answer exactly to this explanation. The inner and centre bow have their colours in the same order. They both appear to spring from the same points of the horizon, as they ought; because the *sum* of the heights of the two bows must be equal to twice the angle of the primary bow. The centre bow appears to mix itself with the exterior, or secondary bow. This circumstance enables us to point out with tolerable exactness when the observation, as represented in the drawing, was made. The interval between the primary and secondary bow being somewhat above 8°, the sun's altitude must have been about 4°. Now, on November 14, in lat. 54° 36', this took place about thirty-five minutes past three o'clock. It is said it lasted at least ten minutes and till sunset. Probably what was supposed to be the setting of the sun was occasioned by its disappearing behind a low cloud. As the phenomenon does not appear to have been observed more than ten minutes, no material alteration would have taken place in the relative positions of the two primary bows."

Varieties.

TALK ABOUT THE WEATHER.—In our climate the weather is the threshold of conversation—the stepping-stone to chat—a proffered ticket of civility between strangers—a no-man's land that is every man's land—a debateable district, where we may meet and join forces. To tell a person that it is wet to-day and that it was fine yesterday, may neither add to his stock of knowledge, nor denote yourself to be a man of original ideas and pithy sayings; yet it is a valuable method, whereby we bridge over the little gulf of diffidence or difficulty that may lie between us and the commencement of a conversation. The observations in themselves may be shallow and obvious, but they are far from worthless, inasmuch as they show a desire that the speaker wishes to be civil to the person whom he addresses, and that he does not care to shut himself up in reserve, like a social hedgehog in his bristles. Such weather remarks are to be accepted as the raising of the hat—the initial of politeness—the signal for the ball of conversation to be set rolling. Ordinarily, we know quite as much about the weather as can be told us; for, besides consulting-glasses, barometers, weather-cocks, and Darby and Joans, we may possibly possess sundry bodily barometers in the unpleasant shape of corns, rheumatism, or neuralgia, from which we get those twitches, shoots, jerks, and aches which foretell and accompany atmospheric changes. Yet we must talk about the weather, and compare notes thereupon with our neighbours. What would be the half-hour before a dinner-party without the weather's aid in introducing guest to guest, as though it were another Beau Nash bringing strangers together, and setting folks at their ease at a Bath assembly? It opens out so many subjects—as to the crops or the flower garden, or to drives and walks, or to croquet and hunting, and a hundred other things. The weather is the open-sesame key with which we unlock a little barrier, and, having passed it, we may wander at our own sweet will—who can say where?—*Outhbert Bede.*

SYDNEY SMITH'S DESCRIPTION OF MRS. FRY.—There is a spectacle which this town exhibits that I will venture to call the most solemn, the most Christian, the most affecting, which any human being ever witnessed. To see that holy woman in the midst of the wretched prisoners, to see them all calling earnestly upon God, soothed by her voice, animated by her look, clinging to the hem of her garment, and worshipping her as the only being who has ever loved or taught them, or spoken to them of God—this is the sight which breaks down the pageant of the world, which tells us that the short hour of life is passing away, and that we must prepare to meet God, that it is time to give, to pray, to comfort, to go like this blessed woman and do the work of her heavenly Saviour, Jesus, among the guilty, among the broken-hearted and the sick, and to labour in the deepest and darkest wretchedness of life.

THE MORGUE IN PARIS.—It is not generally known that the name Morgue is derived from the second wicket, or inner gate, of the Châtelet prison, which was called La Morgue, and where newly-arrived prisoners were detained for a few minutes, in order that the warders might obtain a good view of them (*les morguer à leur aise*), for the purpose of identification. Subsequently, all dead and unclaimed bodies found in the streets of Paris, or in the Seine, were brought to this prison gate, and this custom continued until 1804, when a special building called the Morgue was erected. The establishment of the present recently-erected Morgue on the point of the island behind Notre Dame consists of a superintendent, a clerk, and three assistants. The first receives £84 per annum, the four latter £48 each—small pay, it must be admitted, for the revolting and hard work they have to perform. The superintendent is a very remarkable man, possessing as keen a desire to identify a dead body as the "blind man" at the General Post Office has for deciphering very illegible addresses on letters. The slightest mark on the body or clothes of the deceased, which would remain unnoticed by a casual observer, serves as a clue to him, by which means communications are made to the relatives or friends of the deceased. Great exactitude prevails in the organisation of the establishment. A *procès-verbal*, containing no less than twenty particulars relative to the sex, age, manner of death, etc., of the deceased, is drawn up by the superintendent, and should this means and the exposure of the body for three days fail in leading to its identification, it is buried at the expense of the city, the establishment of the Morgue receiving 6*fr.* 50*c.* for each burial. The most striking and melancholy fact connected with the Morgue is, that the

number of dead bodies brought within its walls has been increasing during latter years in a frightful ratio, and out of all proportion to the increase of the population. Thus, in 1846, the number was 302; in 1856, 475; in 1866, 733; and in the first nine months of the present year, 697. Of the 733 bodies deposited in the Morgue in 1866, 486 were men, 86 women, and 161 infants. Of 445 who were identified, 235 committed suicide by drowning, 19 were homicides, 36 hanged themselves, 5 committed suicide by firearms, 3 by knives, 6 by charcoal, 6 by poison, 3 died from starvation, and 82 from sudden death in the streets. The greatest number of bodies are brought to the Morgue in June and July, the fewest in December and January. Gambling on the Stock Exchange is stated to be the most fruitful cause of suicide; the great facility that exists in the Paris Bourse for such gambling tempts thousands of persons to participate in it. The number of infants brought to the Morgue tallies with unvarying regularity with the time of the Carnival. Nine months after that season of debauchery the Morgue invariably receives a greater number of unfortunate infants than at any other time of the year. For everybody brought to the Morgue the establishment pays fifteen francs.

ANECDOTE OF LORD ELDON.—The Chancellor was sitting in his study over a table of papers, when a young and lovely girl, somewhat rustic in her attire, slightly embarrassed by the novelty of her position, but thoroughly in command of her wits, entered the room, and walked up to the lawyer's chair. "My dear," said the Chancellor, rising and bowing with the old-world courtesy, "who are you?" "Lord Eldon," answered the blushing maiden, "I am Bessie Bridge, of Weobly, the daughter of the Vicar of Weobly, and papa has sent me to remind you of a promise which you made him when I was a little baby, and you were a guest in his house on the occasion of your first election as Member of Parliament for Weobly. 'A promise, my dear young lady?' interposed the Chancellor, trying to recall how he had pledged himself. "Yes, Lord Eldon, a promise. You were standing over my cradle when papa said to you, 'Mr. Scott, promise me that, if ever you are Lord Chancellor, when my little girl is a poor clergyman's wife you will give her husband a living;' and you answered, 'Mr. Bridge, my promise is not worth half-a-crown, but I give it to you, wishing it were worth more!'" Enthusiastically the Chancellor exclaimed, "You are quite right; I admit the obligation; I remember all about it;" and then, after a pause, archly surveying the damsel, whose graces were the reverse of matronly, he added, "But surely the time for making good my promise has not yet arrived? You cannot be any one's wife at present?" For a few seconds Bessie hesitated for an answer; and then with a blush, and a ripple of silver laughter, she replied, "No, but I do so wish to be somebody's wife! I am engaged to a young clergyman, and there is a living in Herefordshire, near my old home, that has recently fallen vacant, and if you give it to Alfred, why then, Lord Eldon, we shall be married before the end of the year." Is there need to say that the Chancellor forthwith summoned his secretary, that the secretary forthwith made out the presentation to Bessie's lover, and that, having given the Chancellor a warm expression of her gratitude, Bessie made good speed back to Herefordshire, hugging the precious document the whole way home?

BETHELL'S INVENTIONS AND PATENTS.—In Mr. Timbs' last "Year Book of Facts," there is an interesting notice of the late John Bethell, brother of Lord Westbury, the ex-Chancellor. Having spent some years in legal practice as a London solicitor, Mr. John Bethell turned his attention to chemistry and mechanical pursuits, producing numerous important inventions, and, with better fortune than usually befalls inventors, deriving substantial profit as well as distinction from some of his many patents and commercial operations. "In 1838 Mr. Bethell introduced the process by which he is most generally known, viz., the preserving timber from decay and the attack of insects and worms by impregnating it with oil of tar, commonly called creosote oil,"—a process that was immediately adopted by Brunel and the younger Stephenson. Of the engineer's other more notable achievements, Mr. Timbs observes:—"In 1840 Mr. Bethell took out a patent for treating inferior animal and vegetable salts, by depositing the mucilaginous and gelatinous matter from them, and mixing them, or distilling them over, with light hydrocarbons, to obtain good lamp oils. In a patent taken out by him in 1843, a very ingenious mode of drying grain upon a system of endless cloths on revolving rollers is

described; also a method of preserving meat by injecting into the arteries of a newly-killed beast pyroligneous acid, and afterwards common brine; also a very excellent mode of preserving milk or acid wines by impregnating them with carbonic acid gas. In 1853 he patented a new method of preserving wood by injecting it with a solution of metallic salt, heating it in a stove to drive off the water of the salt solution, and then plunging it in oil. In the same year he patented an improved method of wetting flax by the aid of warm water. In 1854 he patented a method of making coke from non-coking coal, by previously mixing it with from twenty to twenty-five per cent. of coal-tar pitch. In 1855 he patented a method of preserving meat, vegetables, and fruits, by drying out the water contained in them, at a temperature lower than that required for the coagulation of albumen. Meat and vegetables preserved by him in this manner were supplied to our troops in the Crimea. In 1857 he took out a provisional specification for a method of building composite ships of T-iron and wooden planks. In the same year he patented a steam-plough, consisting of a rotary digger or excavator combined with a traction engine. In 1858 he patented a method of separating iron pyrites from coal, the former to be used in the making of vitriol. . . . Mr. Bethell also bestowed much labour upon a plan for concentrating all the London gasworks at a site some miles down the river. He carried on for some time a distillery of beet-root spirit in Berkshire; and endeavoured for years to obtain the removal of the Customs regulations, which practically forbid the introduction of profitable beet-sugar and spirit industries into this country. He also effected considerable improvements in the extraction of copper from ores of low percentage. He left to his widow and sons the management of many important creosoting and chemical works in England and abroad."

SIR ROBERT PEELE'S GERMAN SYMPATHIES.—"Whitehall, October 10, 1841.—My dear Mr. Bunsen,—My note merely conveyed a request that you would be good enough to meet Mr. Cornelius at dinner on Friday last. I assure you that I have been amply repaid for any attention I may have shown to that distinguished artist, in the personal satisfaction I have had in the opportunity of making his acquaintance. He is one of a noble people distinguished in every art of war and peace. The union and patriotism of that people, spread over the centre of Europe, will contribute the surest guarantee for the peace of the world, and the most powerful check upon the spread of all pernicious doctrines injurious to the cause of religion and order, and that liberty which respects the rights of others. My earnest hope is that every member of this illustrious race, while he may cherish the particular country of his birth as he does his home, will extend his devotion beyond its narrow limits, and exult in the name of a German, and recognise the claim of Germany to the love and affection and patriotic exertions of all her sons. I hope I judge the feelings of every German by those which were excited in my own breast (in the breast of a foreigner and a stranger) by a simple ballad, that seemed, however, to concentrate the will of a mighty people, and said emphatically,

'They shall not have the Rhine.'

They will not have it—and the Rhine will be protected by a song, if the sentiments which that song embodies pervade, as I hope and trust they do, every German heart. You will begin to think that I am a good German myself—and so I am, if hearty wishes for the union and welfare of the German race can constitute one. Most faithfully yours, ROBERT PEELE."

WILLIAM PENN AND HIS FATHER, ADMIRAL PENN.—The Admiral said, "He might *thee* or *thou* who he pleased, except the King, the Duke of York, and himself; these he should not *thee* or *thou*." But still William would not give his father to expect that he could in conscience make any such exceptions. On parting from him for the night, the Admiral, with evidence of much displeasure, told his son to be ready to go out with him in the coach next morning when called on. William could sleep none that night, his mind being disturbed by a suspicion that his father had determined to take him to Court at once, to see how far courtly surroundings would aid in driving away his Quaker prepossessions. "When the morning came they went in the coach together, without William knowing where they were going, till the coachman was ordered to drive into the Park. Thus he found his father's intent was to have private discourse with him. He commenced by asking him what he could think of himself, after being trained up in learning and courtly accomplishments, nothing being spared to fit him to take the position of an ambassador at foreign courts, or that of a minister at home, that he should now become a Quaker. William told him that it was in obedience to the

manifestation of God's will in his conscience, but that it was a cross to his own nature. He also reminded him of that former meeting in Cork; and told him that he believed he was himself at that time convinced of the truth of the doctrine of the Quakers, only that the grandeur of the world had been felt to be too great a sacrifice to give up. After more discourse they turned homewards. They stopped at a tavern on the way, where Sir William ordered a glass of wine." On entering a room on this pretext, he immediately locked the door. Father and son were now face to face, under the influence of stern displeasure on the one hand, and, on the other, prayerful feeling to God for strength rightly to withstand or bear what was coming. William, remembering his early experience on returning from Oxford, expected something desperate. The thought arose that the Admiral was going to cane him; but, instead of that, the father, looking earnestly at him, and laying his hands down on the table, solemnly told him he was going to kneel down to pray to Almighty God that his son might not be a Quaker, and that he might never again go to a Quaker meeting. William, opening the casement, declared that, before he would listen to his father's putting up such a prayer to God, he would leap out of the window. At that time a nobleman was passing the tavern in his coach, and, observing Sir William's at the door, he alighted. Being directed to the room in which father and son were together, his knock came in time to arrest the catastrophe. He had evidently heard of William's return, and of the Admiral's high displeasure. After saluting the former, the MS. says that "he turned to the father, and told him he might think himself happy in having a son who could despise the grandeur of the world, and refrain from the vices which so many were running into."—*The Penns*, by Maria Webb (F. B. Kitts, London).

WELLINGTON'S CRITICISM ON NAPOLEON IN RUSSIA.—"The habit of Napoleon had been to astonish and deceive the world, and he had come at last to deceive himself. When the future prospects of the army were discussed it appears that he never contemplated a retrograde movement to a greater extent than Smolensk. At times he looked to pass the winter in the southern provinces of the Russian empire, about Kalougha, and it appears that he could not bring his mind so far to consider the truth as to calculate the relative strength of the armies opposed to each other upon his flanks, and to ascertain whether it was such as to enable him ever to retreat from Russia. . . . It is astonishing that Napoleon did not attack his adversary previous to the commencement of his retreat, and endeavour to remove him to a greater distance, and especially from the roads from Kalougha to Smolensk. . . . He should have rendered his army as light as possible, and should have destroyed all superfluous baggage. . . . He should then have marched by two or three separate roads. By these modes he might have saved his army, at least from any military disaster; and time, of the greatest importance to him, would have been saved. . . . He marched in one column, which extended the distance of two or three marches."—*Wellington Despatches* (new series).

VULTURES.—At first not a bird has been seen in sight, as I have laid on my back and gazed into the spotless blue sky; but hardly has the skin been half withdrawn than specks have appeared in the heavens, rapidly increasing. "Caw, caw," has been heard several times from the neighbouring bushes; the buzzards have swept down close to my people, and have snatched a morsel of clotted blood from the ground. The specks have increased to winged creatures, at the great height resembling flies, when presently a rushing wind behind me, like a whirlwind, has been followed by the pounce of a red-faced vulture that has fallen from the heavens in haste with closed wings to the bloody feast, followed quickly my many of his brethren. The sky has become alive with black specks in the far-distant blue, with wings hurrying from all quarters. At length a coronet of steady, soaring vultures forms a wide circle from above as they hesitate to descend, but continue to revolve around the object of attraction. The great bare-necked vulture suddenly appears. The animal has been skinned, and the required flesh secured by the men; we withdraw a hundred paces from the scene. A general rush and descent takes place; hundreds of hungry beaks are tearing at the offal. The great bare-necked vulture claims respect among the crowd; but another form has appeared in the blue sky, and rapidly descends. A pair of long ungainly legs, hanging down beneath enormous wings, now touch the ground, and Abou Seen (father of the teeth or beak, the Arab name for the Marabou) has arrived, and he stalks proudly towards the crowds, picking his way with his long bill through the struggling vultures, and swallowing the lion's share of the repast.—*Sir Samuel Baker*.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—Cowper.

HANS PRESENTS THE RESCUED BIBLE TO THE KING OF PRUSSIA.

THE EXILES OF SALZBURG.

CHAPTER XIX.

BARBARA read the letters, with tears of joy, again and again. She was, above all, delighted with the part which told how her Hans spoke to the king, and presented him with the half-consumed Bible saved from the flames. She concealed the precious communications in her bosom. Soon a report spread abroad that all the prisoners were to be released. After many days of sorrow, a glad sunshine appeared likely to rest upon her again. The troop of soldiers being withdrawn from

the neighbourhood, no surly cornet could detain her any longer from proceeding to Salzburg, to be present at her father's deliverance. Leaving her boy, who was not very well, to the care of a neighbour and friend, she quickly hastened on her way to rejoin her Hans.

After an incarceration of one year's duration, the two-and-twenty sufferers were seen staggering out of their dark loathsome dungeons. They stood dazzled by the light and glare of day, which for so long a period they had not beheld under the shining rays of a May-day sun. While, with a deep-drawn inspiration they inhaled the fresh air, Barbara intently gazed at them, and it

was some time before she could recognise her father in one of the grief-stricken forms, pallid and emaciated as he had become. Under his ardent embrace she shuddered at the dreadful smell of mould which exhaled from her father, as from a corpse that had long lain under the earth. With haste she drew her now rescued prize beyond the reach of the fortress, as if she dreaded lest the archbishop might repent of having liberated the victims of his oppression—to which act, however, he had been compelled. But when they had left the walls of Hohen-Salzburg behind, she allowed the weak feet of Manlicken a little rest. He now entirely abandoned himself to the joyful feelings excited by the recovery of his freedom. With infantile delight he regarded the blue sky, the verdure of the trees and meadows, the manifold forms which passed before his feeble eyes, which so long, alas! had gazed on nothing but the dark walls of a prison. With transport he enjoyed the fragrance of May flowers which his daughter plucked for him; with tears of thankfulness he ate the simple food which his child offered him. Then his mind recurred to the tortures he had suffered. He described the dreariness of his subterranean dungeon; the cold he had endured, the hunger which had tormented him, the longing to behold his family, which feeling still so strongly possessed him. For the first time he now inquired for his Catherine, their sons, son-in-law, and grandson. Poor Barbara! dared she poison, as it were, the first emotions of happiness in her father's mind, by the intelligence of his wife's death? Might it not slay the enfeebled husband on the spot? She felt it impossible to answer his inquiry; she therefore turned the conversation to Hans, and related to her father all that he had described in his letters to her, whilst Manlicken shed tears of joy on hearing of the kindness that had been shown to the poor Salzburgers.

"It would have gladdened me much," he said, "if my Catherine had come to meet me; but she has done right to stay at home. She is too good a housewife to leave home when Hans and her sons are all absent. May the Lord long preserve my excellent wife to me!"

Bitterly did Barbara weep at his delusion. But how could she act otherwise? She attempted by degrees and by many a hint to prepare her father for the mournful news, as they were riding in the cart of a peasant, who was returning from Salzburg to the mountains, and who had willingly given them seats in it. The happy man did not understand them, but formed a great many plans for the future, in which very naturally his Catherine was to enact the principal part.

In the neighbourhood of the village of Werffen, the peasant, whose way now lay in an opposite direction, set the thankful pair down, and as chance directed it, not far from the cemetery.

"Barbara," said Manlicken, wearied by the fatigue which he had long been unaccustomed to, "see, there is a little grassy hillock, not far from the road, as if raised on purpose for my weak legs: Let us rest there a short time."

Barbara cast a terrified look at it, and, turning pale, cried, "Oh no, my dear father, not there! see, here is a stone seat, quite convenient, and broad."

"Yes, yes," said Manlicken, shaking his head, "thou deemest my old swollen feet as agile and young as thine own. If thou couldst feel as I do, the trembling of my limbs, thou certainly wouldst not require me to walk a hundred paces further. A stone seat! do not mention it. I had such a one long enough in Hohen-Salzburg, and more than a thousand times I wished for a soft seat of green turf. No, no!" Thus saying, he comfortably

disposed himself on the turf, turning his face towards the spot of peaceful repose.

"When I was lying so ill, from my fall off the timber raft," he began to Barbara, "I had already fixed my mind upon that place," pointing to the cemetery; "now none of us will rest there. Who would have thought it?" He now turned his looks to the other side, though Barbara, to intercept his view, pressed herself closely to him. "Ah, see! a post erected near our seat, and a board upon it! What can it be? Let me see; are there not letters cut upon it?"

Barbara, passionately embracing her father, implored him with broken voice, "Let us go on, father."

"Only have a little patience, my dear; I should like to know if I can still read." He drew nearer to the post, and calmly read the inscription; then, turning himself with a strange smile to his trembling daughter, "My eyes," he said, "have become very treacherous; they would persuade me that there is written 'HERE, FAITHFUL TO CHRIST, RESTETH IN GOD, CATHERINE MANLICKEN!'" His smile changed to horror when he perceived his daughter on the point of fainting. Hastily he once more looked at the record of his unhappiness, and then threw himself prostrate on the grave of his wife, whom vile fanaticism had not permitted to repose even in the consecrated churchyard.

"This," said he, at length raising himself up—"this is the reason she did not come to fetch me from my cold grave, because she was imprisoned there herself. I wronged thee, O faithful soul; forgive me for the injurious suspicion! There lie all the castles which I foolishly built in the air! How did she die?" he then asked eagerly; "as meekly and quietly as was her whole life? Tell me, Barbara, what did she say? Did she think of her Manlicken?"

Barbara, now unable to speak, embraced her father, and he pressed his daughter to his lonely and desolate heart.

CHAPTER XX.

A FEW days afterwards, the last of the Protestants of Salzburg were compelled to quit the land of their birth. Early on the morning of their departure, each left his cottage and garden, prepared for a distant pilgrimage. The father of the family, coming last, silently closing the doors, surrendered the keys to the magistrates of the village who stood by to receive them. The Alp, the meadows, the pastures, were all now deserted; the domestic animals that had long been seen peacefully browsing there were now no longer to be discerned. Cows were lowing in their stalls, and horses neighing, unaccustomed to the sudden tranquillity, as if bidding a last farewell to their master and the industrious housewife who had for the last time provided for them. No pigeons were heard as formerly cooing on the roofs; no poultry were seen in the yards; all were carefully collected and confined, in order to be delivered up to their new owners. The babes rested secure in their cradles, on the shoulders of their mothers; the little children, holding their gowns, trotted by their sides, while the bigger ones, although with some difficulty, under the heavy burdens which weighed them down, walked on before them. Then followed sturdy young men and maidens, weak old men and matrons, supported by strong men, and, finally, the sick in a waggon—a miscellaneous crowd, surrounded by ferocious-looking soldiers. Not a tear was shed, as, silently and peaceably, their eyes cast upon the ground, they passed along the path which led them out of the village. Arrived near the churchyard, all entered there, as if by one accord,

to take a last farewell of the graves of their deceased relatives. At almost every memorial-cross men were piously kneeling, uttering prayers with faltering tones and heads uncovered. There might be seen bent in prayer the grey hair of the aged and the curly locks of the child. Manlicken and Barbara prostrated themselves with anguish at Catherine's mound, which they were about to leave to the neglect of strangers who were now to inhabit the land.

Samland, in Prussian Lithuania, received the exiles. There they were to repeople those vast plains, which the plague had depopulated. The new buildings of those emigrants who had already arrived there were now in sight, and assured the wearied pilgrims that they had reached the termination of their journey. A thousand industrious hands were felling trees, sawing, hammering, cutting up timber, causing plains and forests to resound, as Manlicken and his companions drew near. Hatchet, mallet, and saw, smoothing-plane and hammer, trowel and pickaxe, were thrown aside, as the song was heard of their approaching friends, joined in by hundreds of voices. All abandoned their work; all left their houses and fields to welcome the exiles. Their meeting was joyous beyond description.

There was one absent in that day of rejoicing. Poor Barbara, the noblest heart in the band of exiles, lay cold in a little churchyard near Anspach. She sickened and died on the journey in the village of Little Nordlingen; but they would not leave her in a country where the living had been refused the smallest charity. The priest had forbidden the inhabitants to give even a cup of cold water to the heretics as they passed, and they knew that decent burial would be denied. So they carried Barbara for two days in a waggon, till they laid her in the sheltering and peaceful churchyard of a little village near Anspach, the funeral hymn being chanted by the whole company.

Barbara was absent. But there was one present who was a wonder to many, and of whom the reader will hear with wonder—the young baron who disappeared that night of Barbara's escape. Believing that he had slain Von Rhelingen, and this fear mingling with his other troubles, he was thrown into a state of miserable despair. In this frame of mind, when wandering about, and still ignorant of Barbara's betrothal to another, he had been befriended by some of the faithful neighbours of Manlicken, and his disquietude took the form of genuine penitence for his past life. When he knew all the story of Hans and Barbara, he behaved with chivalrous courtesy to her whose beauty and character had first awakened generous feeling within him. Having thrown in his lot with the persecuted Protestants, he was one of the band that last left the valleys. He was unrecognised and unsuspected, for many Catholics had joined them, grieving over the wrongs of their country. To Barbara he paid every service on the journey and in her illness, and none mourned her with deeper attachment.

"Where is my dear Barbara?" inquired Hans Weinleithner, while embracing his father-in-law. The latter drawing him apart from the multitude, who were joyfully engaged in mutual recognitions and greetings, said to him, significantly, "Hans, dost thou not believe that death is swallowed up in victory? 'O death, where is thy sting?' I know thou believest, and therefore she is not lost to thee!"

Then did poor Hans faintly comprehend his meaning, but at the moment forbore making inquiries on the subject of his sad loss. Of the whole multitude he was the only one who shed tears of affliction; and yet, though

weeping bitterly, he smiled when the Baron Von Motzel, who now called himself Gottwalt (by the power of God) brought his little boy Peter to him. Even Manlicken's seriousness, which had now become habitual, gave way to an expression of gladness, when his two sons, with Peter Pommer and his young bride, came to welcome and embrace him. The cripple was still covered with wood shavings, and his partner also bore marks of the rural employment from which he had just forced her away. Just as hasty in manner as ever, he impatiently insisted on the new comers following him, in order to show them his new house. Unable to resist his kind and urgent invitation, they followed where he and his wife led the way. First went Hans, carrying his child in his arms, and alternately caressing his little one, and wiping away the tears which he could not restrain; close behind him was Gottwalt, to whom Peter was stretching out his little hands; then came Manlicken between his two sons, with Packfest by their side.

Thus the little company passed along newly-sown fields and green meadows to the portion of land allotted to them, and lo! the dwelling, with its outhouses, was the very counterpart of the Schüppelhof at Werffen. The king, to whose intercession the prisoners in Salzburg were indebted for their restoration to liberty, had also procured for Hans, from the sale of the Schüppelhof, to which his claim had been acknowledged, the means for building a substantial and commodious dwelling-house, and, with the exception of their mountains, the exiles again found all that they had considered irrecoverably lost, and still more, a mild and tolerant government. Henceforth the wanderers, who had so long been fellow-sufferers, lived together in the most perfect harmony and friendship.

Gottwalt, as a truly regenerate man, atoned as much as was in his power for the wrongs which he had formerly done. He became the schoolmaster of the new colony, and discharged the duties of his office with zeal and regularity. Hans, some time after, acting on the advice of his father-in-law, gave to his son a kind and faithful mother, and devoted himself to his former occupation of an agriculturist. Peter, blessed with children, and in the exercise of his favourite employment, repaired whatever was broken—houses, stables, barns, or sheds—and when not thus occupied, amused himself by sauntering about the fields. Manlicken brought up his sons in humility and obedience to God; and divided his time between prayer and labour. The whole of the exiles proved, by their peaceful and Christian demeanour, that the favour of the king had not been conferred upon them undeservedly.

CHAPTER XXI.

In the deserted valleys of Salzburg, Gottwalt's father, the warden of Werffen, stood looking with triumph and exultation upon the seventeen farms which he had extorted from the exiles at so trifling a price. He calculated that the profits of this proceeding would amount to 20,000 florins. And thus it was that he had worked himself from the back office of a low notary to be a wealthy baron, and the powerful ruler of an extensive territory—applauded and honoured by the prince and his counsellors, and dreaded by his subjects. The nephew of Von Rhelingen had recovered from his wound, and forgiven the fatal conflict with his son; nay, even the union of the latter with the rich young heiress to whom he had been previously engaged was not absolutely impossible. Elated with joy, he had described everything in a letter he had despatched to his son at Vienna, to which place he had given him strong

letters of introduction. With the greatest impatience he awaited his son's return, to crown his ambitious projects. In the midst of these plans that he was indulging in, he received a letter from his son, now known as Gottwalt. He saw at once the schemes he had laid for his aggrandisement defeated. The now childless father stormed and raved. The haughty baron was the most miserable of men.

For the unchristian expulsion of his subjects, the Archbishop Leopold Von Firmian was rewarded with a letter of approbation from the Pope, and the title of "Excelsus." This, however, afforded him but little comfort when he lay upon his death-bed. In vain his attendants supported him, and smoothed his luxurious eider-down pillows; the long prayers of the numerous priests who surrounded him availed not to assuage his anguish. He shuddered as he gave back the silver image of the crucified Saviour, whose command of charity he had so recklessly transgressed. No tears of a beloved wife or child soothed his fevered mind, no gentle hand wiped the cold damp of death from his pallid countenance, or closed his glazed eye. Unlamented they laid him in his magnificent sepulchre.

When thou comest, sight-loving traveller, to the charming capital of Salzburg, the cicerone will show thee the stables once belonging to the archbishop, where one hundred and fifty horses were fed out of mangers of white marble, and were bathed in a reservoir of the same costly material, ninety-three feet in length, in the midst of which a gigantic prancing steed is beheld, from whose nostrils issues a lofty jet of water, whose bridle is held by the statue of a groom also cut of the solid marble. Leopold Von Firmian caused this magnificent structure, with its costly sculpture, to be erected to perpetuate his memory; those who suffered from his severity remarked that it served also as a memento to show that he preferred brute creatures to his fellow-men. Frederick William I likewise erected for himself a monument; a monument imperishable, and which reflected a greater lustre on his name than did that of Firmian. History tells of the twenty thousand Salzburgers to whom he gave an asylum, and who thus by bloodless means he incorporated into his kingdom. They have since increased to hundreds of thousands, and repaid tenfold the care bestowed on them by their assiduous industry.

Manlicken lived seventeen years in Prussia. The latter part of his life was not free from bodily pain, and his feet often swelling, the consequence of his confinement in the damp prison, confined him much within doors. He therefore frequently longed to depart to Christ, and be with his Catherine and Barbara. One summer evening, in the year 1749, they found him on his easy-chair, with his hands folded on the Bible which was lying before him, and his eyes directed towards heaven, as if in prayer. The hands were cold, and the eyes raised to heaven were stiff and glazed. His spirit had departed to heaven. The passage in the open Bible on which his hands rested was, "I know that my Redeemer liveth."

The lamentations of the exiles have long since been silenced. Since the period of our narrative a hundred years have elapsed, and a new generation has sprung up. Peacefully are friends and foes slumbering in the bosom of mother earth. One only of the exiles was yet alive. For when their descendants were celebrating the great jubilee of 1832, in remembrance of their

emigration into Prussia, thousands flocked around a venerable old man, who, more than a century old, stood as the monument of a past generation. It was Peter Weinleidtnr, who, when a child of a year and a half old, had entered their new fatherland, led by Gottwalt. The new Shippen yet preserves its name; while Manlicken, Pommer, Weinleidtnr, and Gottwalt, live again in their children and grandchildren.

LIFE IN JAPAN.

JAPANESE LADY AND CHILD.

MARRIAGE.

MARRIAGES can only take place between persons of the same rank in life; and sometimes it happens that there is only one family of a particular class residing in a town. A partner must then be found for any of the marriageable sons and daughters in some other locality. Thus, if the governor at Nagasaki has grown-up children, he must make alliances for them amongst the children of some person of an equal rank; and as there is no one near whose position is similar to his own, an eligible parti or partie has to be sought for at a distance. Marriages generally take place at an early age. When a youth has seen a maiden whom he wishes to make his wife, he plucks a branch from a shrub (the *Celastus alatus*) and fastens it to the doorway of her parents' house. If the young lady does not reciprocate

his affection, she leaves the branch to wither and die, and the lover knows his suit is rejected, without being subjected to the disagreeable of a verbal refusal; if, on the contrary, she is willing to become his bride, she blackens her teeth, and thus proclaims her engagement. Such an evident sign of betrothal prevents any other lover making the mistake of proffering his suit to a lady whose promise has been already given, as occasionally happens in England. Friends of both the lovers are then summoned to discuss the arrangements for the wedding, to settle the terms of the marriage contract, and to choose two auspicious days from the almanack—the first for an interview between the betrothed pair, and the second for the wedding. The bridegroom then sends valuable presents to his future wife, who gives them to her parents. The parents then make a suitable return to their future son-in-law. The young lady burns all her childish toys, to intimate that her girlhood is over, and that she must now attend to the serious business of life. Her parents give her a handsome wedding dress, and some useful articles of furniture, which always include a spinning-wheel, a loom, and culinary utensils, of all of which the future wife is supposed to know how to make a practical use. These presents are conveyed with much state and ceremony to the bridegroom's house on the wedding-day, and there exhibited to the guests. Marriage is considered a civil contract, but it is usual to call in the priests of the religious sect to which the families belong to consecrate the nuptials. Prayers are offered, benedictions bestowed, and bridal torches are kindled; the bride's is lighted from the fire on the altar, the bridegroom's from hers. The meaning of this is both obvious and poetic. The bride is dressed entirely in white, and covered with a veil, which is carefully preserved when the wedding ceremony is over, and laid by till her death. It is then used as a shroud. It is said that the wedding veil is reserved for this melancholy purpose in order to remind the young wife that she is now dead to her father's home and family.

Arrayed in fine white garments, she is seated in a kind of sedan-chair, and, escorted by her relatives, is carried to her new home. Upon reaching it, still covered with the veil and accompanied by two young girls, she passes into the principal room, where the bridegroom sits awaiting her, and surrounded by his parents and friends. In the centre of this room stands a table, upon which are some small figures representing a fir-tree, a plum-tree in blossom, a crane, and a tortoise—emblems respectively of man's strength, woman's beauty, and a long and happy life.

Upon another table stand bottles and cups. The bride approaches this table, and commences her wifely duties by pouring out sake, and distributing cups of it amongst the guests. Many minute forms are carefully attended to in this pouring out of wine, in which the bridesmaids, who are fancifully called butterflies, take a distinguished part, as this drinking of wine completes the bridal ceremonial. Three days afterwards the bride and bridegroom visit her parents to pay their respects to them.

Polygamy is not allowed in Japan, but it is not considered a disgrace for men to have a number of concubines, in addition to the one legal wife. Any children there may be are rendered legitimate by being adopted by the wife. Married women of the middle classes are allowed perfect liberty of action, and they assist their husbands in their various occupations, and their conduct as a rule is irreproachable, though laxity of manners before marriage is not deemed a disgrace, nor is it any

impediment to a marriage with a man in a respectable position.

Women of the upper classes are noted for their modesty, grace, and beauty, and the annals of the country are enriched with many incidents in which they have taken an active part.

BATHING.

The constant use of the warm bath is a great feature of Japanese life. It is not a luxury reserved for the wealthy in the seclusion of their homes, but a national habit indulged in by the lower classes in the most public manner. It has been suggested that the system of espionage for government purposes universal in Japan has gradually obliterated the reserve as to personal matters which seems instinctive in most civilised communities. It is difficult to assign a cause for such a remarkable result; but no one passing through a Japanese village or town towards evening can fail to perceive that the whole population is indulging in the bath, either in the little gardens or courtyards at the back of the houses, or at the public institutions where, on the payment of a few "cash," men and women can have a tub with a plentiful supply of warm water. When the tubs are made use of in the back gardens just referred to, it is not considered necessary to close the sliding panels which shut out the view from passers-by in the street; and if the advent of a foreigner, or any other incident should arise to attract attention, the bathers will leave their tubs without waiting even to throw on their loose garments, and run to the door in a state of nudity to see what is passing. Those who object on the score of morality to such a want of personal reserve will find their objections strengthened by the general laxity of conduct which they cannot avoid observing when residing among these singular people. It is said that when Lord Elgin's embassy proceeded to Yeddo on their first visit, that everything which it was known would in any way shock the European sense of propriety was carefully concealed. If this be true, it shows that the Japanese can appreciate the scruples of other nations even when opposed to their national habits. It accounts also for the favourable reports then made of Japanese morals.

Besides the warm water bath, vapour baths are also in request, and many of the dwellings have a very simple arrangement at the back of the garden or courtyard for this kind of bath. A small apartment, three to four feet high, with a floor of narrow planks of wood placed a few inches asunder, is built over the stove which heats the warm water for the general family bathing; there is a small aperture, through which the individual desiring to be steamed creeps in, and there are two large tubs of water, one warm and the other cold. The atmosphere of this little chamber soon becomes intensely warm and full of vapour; but the bather can regulate it as he pleases, as there are two small windows at the side to let off the steam, and he can also plunge into the tub of cold water when he chooses.

This constant bathing is doubtless very conducive to health, but it is unfortunately not accompanied in the lower classes with cleanliness of clothing. The same garments are put on without being washed time after time, until no longer wearable, so that much of the benefit arising from the free use of the bath is lost; still it is better than the custom of our lower classes, many of whom seldom bathe at all.

Sir Rutherford Alcock, formerly our minister in Japan, considers that the public baths have an important bearing on Japanese political life, as it is there that

great numbers of people, male and female, meet, and discussions arise on all subjects, and thus public opinion is formed in a community which possesses no periodical literature similar to our newspapers. In these discussions women have equal rights with men, and thereby conduce to the permanence of the Japanese Government; for, according to Sir Rutherford's views, women do not often become political conspirators, and therefore the influence of woman is to be viewed as a conservative element in the state. In the present state of public affairs in Great Britain, when women are endeavouring to obtain the franchise, this view may have a bearing upon our own political life.

Shampooing is an operation much indulged in by the Japanese. It is very different from what is called shampooing in England, which consists merely in having the head well washed. According to the Eastern idea it is the calling in of a skilful operator, who subjects every muscle in the body to a gentle kneading and rubbing, which dissipates fatigue, and renders the stiffened muscles easy to move and free from pain. The luxury of such a process is best appreciated by those who have undergone some unusual bodily fatigue, and who find, after they have undergone it, that all the weariness and distress they experienced are removed as by a charm.

THE MEASUREMENT OF TIME.

An important branch of Japanese education consists in learning the almanack: the chronological system being most complicated. The year is divided into twelve months, distinguished by the twelve signs of the zodiac, which according to Japanese astronomy are named after twelve animals, viz., the mouse, the bull, the tiger, the hare, the dragon, the snake, the goat, the monkey, the dog, the boar, the horse, the cock; but these twelve months vary in length year by year, and the Mikado, or sacred emperor, at his court at Miako, arranges the number of the intercalary days and the months to which they are to be added.

Even an answer to the ordinarily simple question of "What's o'clock?" requires the exertion of much thought and calculation, before it can be answered according to the Japanese system.

The diurnal revolution of the earth is divided into twelve parts, and if these divisions were reckoned consecutively there would not be much difficulty in ascertaining the time of the day or night: but owing to the peculiar sacredness attached to the number nine, the principal epochs of day and night, namely, noon and midnight, are both known by the number nine. And the whole system of numbering the divisions of time is based upon the multiples of this perfect number, and upon the circumstance that sunset and sunrise are always called by the number six. Thus if we begin to reckon from noon, that is called the hour of nine: for the next division of time we take twice nine, or eighteen; subtracting the decimal, eight remains: it is therefore called the hour of eight. For the next or third hour, the third multiple of nine is used, *i.e.*, twenty-seven. The decimal number is again subtracted, and seven remains; for the fourth division, the fourth multiple, thirty-six; and again subtracting the tens, we have six left, which must be the hour of sunset: next the fifth multiple, or forty-five; subtracting the forty leaves five, or the fifth hour; and so with the sixth multiple, or the hour of four. The succeeding division is midnight, at which point the numbering recommences, with nine and its multiples; the fourth division is again six, or sunrise, and so the circle is completed at noon.

In order to distinguish the divisions of the day from

those of the night, besides the number belonging to each division of time, it is also called by the name of one of the twelve signs of the zodiac: thus midnight, or nine, is the hour of the mouse; sunrise, or six, the hour of the hare; noon, that of the horse; sunset, that of the cock. The subjoined table may make these daily divisions of time clear to those who have not understood the foregoing explanation:—

Noon . .	9th hour, called also	The Horse.
8	”	”	The Goat.
7	”	”	The Monkey.
Sunset . 6	”	”	The Cock.
5	”	”	The Dog.
4	”	”	The Boar.
Midnight 9	”	”	The Mouse.
8	”	”	The Bull.
7	”	”	The Tiger.
Sunrise . 6	”	”	The Hare.
5	”	”	The Dragon.
4	”	”	The Snake.

As sunrise and sunset must always be called the sixth hour, this introduces another element to complicate the calculation, in order to allow for the variation constantly taking place in the relative length of the day and night. It necessarily follows from this that in the summer the divisions of the night succeed each other much more rapidly than in the winter, and that those between sunrise and sunset are proportionably prolonged.

It is one of the duties of the priests in the temples to mark the lapse of time by sounding their beautiful bells, and the practised ear soon recognises, even in the depth of night, whether it is the hour of the boar or the bull that has just been rung out on the silver-toned bells by the watchful priests.

The native methods of measuring time resemble those made use of according to tradition by our King Alfred the Great. Instead of a candle marked with painted bands of different colours, the Japanese use a small beam of wood, the upper part covered with a kind of glue and white-washed. A narrow groove is made in the glue, and on each side of the groove at certain distances there are holes for nails. The groove is filled with a powder, which has the property of burning very slowly, and thus the divisions of time are literally consumed. Every three months the distances between the nails are readjusted, so as to allow for the alterations in the lengths of the days and nights.

LOVE BY TELEGRAPH.

We often hear of "love at first sight," but a curious case lately happened of courtship carried on, and marriage arranged, without the lovers seeing one another at all. Telegraph clerks are in the habit of sending inquiries and messages on their own account, when the wires are free and time is heavy on their hands. The "good morning" salute, and the natural question, "What is your name?" soon expand into general subjects of conversation. A clerk, finding he had a fair correspondent, not unwilling to exchange messages, soon began to "wire" love-letters to her, with the romantic result of making a match of it. Our informant, a director of the company, assures us that this is not a singular case. The story reminded us of a remarkable paper of Addison in the "Spectator," where the electric telegraph itself, and this special use of it, seem to be anticipated. The paper is on absent lovers, and the methods by which the pains and inconveniences of absence may be relieved. Among the contrivances suggested is that described as follows:—

"Strada, in one of his Prolusions (Pro. 6), gives an account of a chimerical correspondence between two friends by the help of a certain loadstone, which had such virtue in it, that if it touched two several needles, when one of the needles so touched began to move, the other, though at never so great a distance, moved at the same time, and in the same manner. He tells us that the two friends, being each of them possessed of one of these needles, made a kind of dial-plate, inscribing it with the four-and-twenty letters, in the same manner as the hours of the day are marked upon the ordinary dial-plate. They then fixed one of the needles on each of these plates, in such a manner that it could move round without impediment, so as to touch any of the four-and-twenty letters. Upon their separating from one another into distant countries, they agreed to withdraw themselves punctually into their closets at a certain hour of the day, and to converse with one another by means of this their invention. Accordingly, when they were some hundred miles asunder, each of them shut himself up in his closet at the time appointed, and immediately cast his eye upon his dial-plate. If he had a mind to write anything to his friend, he directed his needle to every letter that formed the words which he had occasion for, making a little pause at the end of every word or sentence, to avoid confusion. The friend, in the meanwhile, saw his own sympathetic needle moving of itself to every letter which that of his correspondent pointed at. By this means they talked together across a whole continent, and conveyed their thoughts to one another in an instant over cities or mountains, seas or deserts.

"If Monsieur Scudery, or any other writer of romance, had introduced a necromancer, who is generally in the train of a knight-errant, making a present to two lovers of a couple of these above-mentioned needles, the reader would not have been a little pleased to have seen them corresponding with one another when they were guarded by spies and watches, or separated by castles and adventures.

"In the meanwhile, if ever this invention should be revived or put in practice, I would propose, that upon the lover's dial-plate there should be written, not only the four-and-twenty letters, but several entire words which have always a place in passionate epistles, as *flames, darts, die, languish, absence, Cupid, heart, eyes, hang, drown*, and the like. This would very much abridge the lover's pains in this way of writing a letter, as it would enable him to express the most useful and significant words with a single touch of the needle."

STRANGE AND SAD.

ONE breezy day last autumn, tempted by the colour in the fading woods, and the rich creamy glow in the wandering clouds, I put my tin box of moist colours in my pocket, tucked my portfolio under my arm, and seizing my patent easel, which is also walking-stick and seat, sallied forth upon a sketching expedition in one of the midland counties. After jotting down here and there such bits of the landscape as struck my fancy, and wandering from one point to another, first in search of the picturesque, and then in search of a dinner—in which latter quest, by the way, I was not very successful—I came rather late in the afternoon upon the reedy margin of a wide-spreading sheet of water. The scene was new to me, and was also of a character which I had never met with before in all my perambulations, and they have not been few, in the rural districts of

England. The lake before me was not much less than half a square mile in area, and it was connected by a winding stream, which trickled over rocks and big smooth stones for the distance of two or three hundred yards, with another lake of scarcely less diameter, the boundary of which was in part hidden by a swell of land to the right. The marginal shallows of both lakes were covered with reeds and flags, among which rose thousands of enormous bulrushes whose black heavy heads nodded perpetually, rising and falling as they were swayed by the breeze; and among the reeds colonies of wild fowl had made their homes, which, as they rose from their lairs and shot across the surface of the water, streaked the blue expanse with broken lines of purest white. The land rising in gentle swells on both sides of the water was of richest green pasture, upon which herds of fine cattle and flocks of sheep were feeding; but unlike the pasture land of the district, it was unenclosed for the space of hundreds of acres, and was dotted so closely with fine grandly-grown elms, oaks, beeches, chestnuts, and other trees, as to close up the foreground view within the distance of a mile. There were breaks, however, in this woody barrier which let in the view of a distant weald of flat meadow lands, corn-fields, and patches of arable; and beyond these were wooded tracts which showed a dense blue tint in the clear, breezy autumnal air—the deep colour melting off into purple and grey where a long line of far-off hills bounded the horizon.

Ascending a slope on the right towards a long belt of wooded land which girded the summit, I came suddenly upon a broad level area where the grass grew wild and rank, and waved over the remains of masonry dense and solid, which here and there cropped out above the sward. A little attention showed me that these were the foundations of some building which had been razed to the ground years ago; and on noticing the width of the walls, and the large extent of the ground they had once enclosed, I came to the conclusion that here must have stood a large mansion, which in years past had probably succumbed to fire, and had never been rebuilt.

Speculating on what might have been the past history of the place, I arranged my sketching materials and set down to work. While washing in the colours and listening to the ripple of the water against the sides of an old flat-bottomed boat which lay moored at a clearing among the flags at the foot of the slope, I was aware of a shadow which crept over the paper projected from an object behind me, and looking round, saw an old man leaning on a stick. He had approached unawares, and seemed to be curiously watching my proceedings.

"Do you know," said he, before I had time to speak, "what you are painting, and where you are sitting?"

"No, I do not; I am just amusing myself. I am a stranger to this neighbourhood. Was there not formerly a house on this spot?"

"I should think there was; as grand a place as you might see in a day's journey—Forester Hall, it was; I mind it well, though it's sixty-five years ago since one stone of it stood on another."

"Destroyed by fire, I suppose?"

"Worse than that—a hundred times worse than that," said the old man, in a tone of voice which at once excited both curiosity and interest.

I waited for him to proceed, but he stood silent, looking out over the waters with a dreamy kind of gaze, while the long white hair streamed in the wind. At length, by way of prompting him, I said, "What can be worse than fire?"

"Anger is worse—hatred is worse—revenge is worse!"

—and the old man was silent again for some minutes. The “ancient mariner” came across my mind, and I felt sure he would tell me the story, whatever it was, and I judged it likely that I should get it all the sooner by allowing him to take his own course. I was right in this conjecture. After watching the ups and downs of my pencil for some time, he sat down upon a part of the foundations at my side, and began a narrative, which, prolix and garrulous as he was, occupied him for the best part of an hour. My sketch was finished before his story, but I made a show of work by touches and retouches here and there, in order to allow him to get fairly to the end of it, and was thus enabled to hear it to the close. I shall be much more brief than my informant in imparting the substance of it to the reader, and shall confine myself entirely to facts, disguising only the names of the actors.

Sir Handley Forester was the only son of a Bristol merchant who had risen from a comparatively low rank in life to the possession of enormous wealth. The father and son had carried on their business together, without admitting any other members to the firm; and it was said that the old man derived the mass of his gains from a traffic which few people in his day cared to denounce, though at a later period it became deservedly infamous. For some mere ceremonial service, Handley, the son, was knighted by George III—an honour which, valued highly by himself, was still more prized by his father, who seemed from that time to make it the chief subject of his thoughts. The old man saw in his son's elevation the climax of all his aspirations, and it was evident to all who were intimate with him, that, in his estimation at least, his son's new dignity outweighed in importance their united acquisitions of wealth. But the elder Forester died within the year, and then Sir Handley found himself heir to vast riches, to which, however, was attached the condition that he should marry within a twelvemonth, and at a certain specified period should abandon commerce, and retire to an estate which the old man had already purchased in his native county. There he was to build a noble residence, to increase his landed property by purchase as opportunity offered, and to transmit the whole at his death to his eldest son, or, failing to have sons, to the husband of his eldest daughter: he was further to leave no means untried to get the baronetcy perpetuated in his family.

Sir Handley might have preferred to continue amassing wealth by commerce; still he could not but conform to his dead father's wishes. He married well, as the phrase goes, within the allotted period, but it was ten years before his commercial affairs were wound up, and by that time his wife had died, leaving him two sons, Roger, born within a year of the marriage, and Martin, born seven years later.

Meanwhile the noble building of Forester Hall had risen on the country estate; adjoining lands had been purchased and added to the original domain; hundreds of broad acres had been drained and levelled, and planted, and laid out in a magnificent park; two ample lakes had been dug and filled by turning the course of a neighbouring brook; the waters had been stocked, and around the mansion rare gardens bloomed, flanked by shady walks and shrubberies; and a broad gravelled carriage-drive led from the outer lodge between an avenue of rising trees. Sir Handley settled permanently in his grand home when his eldest boy Roger was entering on his eleventh year, and he was himself approaching towards fifty. His wealth, and his liberal manner of dispensing it, rendered him a welcome addition to the

best society of the neighbourhood. It was soon discovered that he was hospitable beyond the hospitality of the period, while he was uniformly generous whenever appealed to. It was not discovered that he was merely a new man with no lineage to boast—for the heralds' college had provided him with an ancestry and a coat-of-arms which nobody cared openly to criticise, seeing that their owner and representative was guiltless of vaunt or pretension of any kind. He had no thought of marrying again; it suited him better to delegate the domestic control of his large household to responsible servants under the surveillance of a widow lady, a relative of his own, who took upon herself the part of mistress of the house. The boys were educated under his own eye. For Roger, a private tutor, a man who stood high in his college, had been engaged; and under his tuition and guidance, the boy developed by degrees into a generous, frank, free-hearted and accomplished young gentleman, the pride and delight of his father, and the admiration of the neighbourhood. Martin, the younger son, as his disposition began to manifest itself, was not the source of equal satisfaction: he seemed to have inherited much of the obstinate self-will which had characterised his grandfather, together with a recklessness which demanded continual guidance and restraint. At a proper age, however, he partook in the same advantages which his brother had enjoyed, and was, far more than Roger had ever been, the object of the tutor's anxiety and watchfulness.

The course of life at Forester Hall during the boyhood and youth of Sir Handley's sons, was much what it is in all large country mansions where the proprietor is almost a constant resident, and presents nothing demanding particular note. Roger went to college, where he gained repute by his talents, and consideration of another sort by the free and generous use of the wealth at his command. He afterwards made the customary “grand tour” of those days, in which his father, who could not relish the idea of a long separation, travelled with him for a considerable time. After his return the hall was a different place from what it had ever been; visitors thronged the rooms during the entire summer and autumn, and during the winter months parties of sportsmen were frequently arriving to make war upon the game, and do honour to the hospitality of the season.

It was about Christmas time in the year 1798, on the birthday of Roger, who had just completed his twenty-fourth year. He had gone out with some of his old college friends after an early breakfast, to shoot rabbits in the copse which stood about half a mile to the rear of the hall. One of his companions was the brother of the young lady to whom he was betrothed, and would be united in the coming spring. Alas! that promising spring, for him, was never to arrive. In crossing a fence, and while in earnest talk heedlessly drawing his gun after him, the piece exploded, and lodged the whole contents of the barrel in his side. He fell dead without uttering a word.

I must pass over the horror of that dreadful day, and the dreary miserable time that followed it. Sir Handley took to his bed; and when he recovered, so far as it was possible for him to recover from so dire a shock, he was an altered man. All that was genial and kindly in his nature seemed to have left him—to have been buried in the grave of his eldest born and favourite son. During his illness he made no mention of Martin save once, and that was to forbid his entrance into his sick chamber. He lost, or seemed to have lost, all command of himself—refused with bitterness all attempts at condolence—

was angry with everybody and everything, and would not be appeased or comforted. The lapse of time, which brought him some relief from sorrow, seemed rather to have hardened than to have softened his resentment against the calamity which had overwhelmed him; his words were invariably stern, his looks and manner resentful, and his actions often vindictive even without cause.

But after keeping his chamber for near a twelvemonth a sudden change came over him. He ordered his carriage one forenoon and drove over his estate, gazing once more upon all around with an interested look, and seeming to be revived by the cool frosty air. In the afternoon he appeared at the dinner-table, and, to the astonishment of his relatives, several of whom were then residing at the hall, asked after Martin, desiring to know why he was absent—a question which none of them seemed able or willing to answer. The meal over, he withdrew to the library, leaving orders that Martin should be sent to him on his return home.

It was late when Martin came, and even then he was in no hurry to seek his father, but deliberately partook of refreshment before he entered the library: Sir Handley, who had scarcely seen him for a year, looked up from his papers and gazed at him with astonishment, in which was plainly visible a feeling of scorn, which however the old man made some effort to suppress. The contrast between the living son and the dead one were almost too much for the father, and there was a tremulous motion about the muscles of his mouth which for a few moments prevented him from speaking. If Martin had any regret for his brother's loss, his ruddy beetle-browed face showed no trace of it now; he stood before his sire with a dogged air, as if prepared to resist and even to resent any proposal that was not in accordance with his own will. Perhaps it was this that induced his father to speak in an abrupt and rather imperious tone.

"Boy, it is my pleasure that you resume your studies under Mr. Attwood, who will be here in a day or two, and prepare yourself for college."

"I am not going to college."

"You will go to college whenever you are fit to go, and the sooner you prepare yourself the better it will be for you."

"It will not suit me, and therefore I shall not go."

"Do I understand that you have the effrontery to oppose my wishes?"

"You are opposing mine; I do but refuse my consent."

This coolness on the part of a lad still in his eighteenth year, was more than the irritable convalescent could bear; he gave way to a violent inroad of passion, and a deplorable scene ensued, the particulars of which it is needless to relate. It ended by the father ordering the son from his presence.

"Go!" said he, "and dare not to enter my presence again until you have learned obedience."

Martin walked off without reply, and allowed weeks to pass away without making the slightest overture to reconciliation. Meanwhile Sir Handley, blaming himself now it was too late, for the freedom which the lad had so long been allowed, and burning with resentment against him, set spies upon his track in order to ascertain where he passed his time, and what were his pursuits. The news which his emissaries brought him was worse than his worst fears. Martin had formed a low connection among the sporting men of the neighbouring county town, whither he now rode almost daily. His principal companion was one Braddon, a lawyer in the

town, of worse than indifferent character, to whose daughter it was said Martin had engaged himself, and indeed was on the eve of being privately married to her, doubtless with the father's sanction, or rather connivance.

Here was a complication, which it required the combination of wisdom and prudence to deal with. By the exercise of patience and gentleness, the lad might perhaps have been freed from the snares and entanglements into which he had been drawn, and his eyes opened to the interested designs of the scheming lawyer. But the wisdom and prudence were wanting. Sir Handley, in his towering indignation, would not stoop to the show of forbearance, much less of gentleness, but hastened to assert his authority with despotic sway. Summoning Martin to his presence directly his return home was announced, he, in a few biting words, made him aware that all was discovered; and then laying before him the draft of a letter he had prepared, bade him copy it and append his signature. The letter was addressed to Braddon; it alluded sarcastically to some blots in his character and antecedents which were only known to few, and then, in terms which could admit of no retractation, affirmed that all relations between him and his family had ceased for ever.

As Martin read the letter a livid pallor spread over his face; but he recovered himself in a few moments and merely said as he laid down the paper, "That is not a letter which one gentleman can send to another."

"You will copy it, and sign it, and it will be sent, notwithstanding. I do not see that any gentleman is concerned in it."

"I shall not copy it, much less sign it," was the reply.

"You will have a quarter of an hour to make up your mind," and as the father spoke, he lifted a hand trembling with passion, and rang a loud peal on the bell. No servant, however, appeared in answer, though steps were shortly heard in the great entrance hall, into which the library opened. Martin sat with his elbows on the table, resting his head on his hands, and not even looking at the letter. Ten minutes had elapsed, and then Sir Handley rang the bell once more, loudly as before. His face was as white and almost as rigid as marble, as he said slowly, "You have still five minutes left."

Martin took no notice of the words, and never changed his posture. There was a dead silence for a time: the little clock on the mantel-piece began chiming the hour, and again the bell rang loudly. The door opened and two strange men entered the room; at a signal from the father, each took an arm of Martin, who made no resistance, and led him forth into the entrance-hall. There the lad saw that all the men servants of the household, from the steward to the stable-boys, together with many of the labourers employed about the gardens and grounds, were drawn up in ranks, and had evidently been assembled for some special purpose. He made no resistance to the proceedings of the men who held him fast, nor while they stripped him to the shirt and bound him to a pillar, did he make any attempt to divert them from their purpose. There, in the presence of some three score of the retainers and menials of the hall, most of whom had known him from his infancy, he was cruelly lashed by the strange men—his father standing by. Martin neither cried nor groaned, nor turned a single glance towards his relentless parent; but after enduring the worst for a time, which seemed an age to some of the lookers-on, his head fell back upon his shoulder, and it was plain that he was no longer conscious. He was borne off to his chamber, and consigned to the care of a medical atten-

dant who had been previously summoned for the purpose.

From that day, neither Sir Handley, nor one of those whom he had summoned to witness that shameful spectacle, ever set eyes on Martin Forester again. He disappeared from the hall one night, ere it was thought he had sufficiently recovered to be moved, and in spite of all the exertions which were subsequently made to discover his retreat, remained securely concealed. The remorse and compunction which had seized his father after the senseless gratification of his revenge, goaded him to every effort for the recovery of the lost heir; but all was vain. Braddon and his family had also disappeared from the neighbouring town, and had left no means by which they could be traced.

The remainder of this strange story is soon told. Sir Handley for a time appeared unmoved by what had passed—made no allusion to it, and perhaps succeeded, by means of the numerous occupations in which he busied himself, in casting aside the heavy burden of his thoughts. But when years had rolled on, and he was still unaware even of the existence of his son, his wounded pride, his mortification, and the destruction of all his hopes, altogether crushed his spirit, and bowed down his once vigorous frame. He lingered on a sick bed month after month; and when pride and passion were quelled by sorrow, he made touching appeals in the public prints to the compassion of his absent son—but no tidings came, and at length, slain by his secret anguish, the old man died.

The very day after the magnificent funeral, at which the whole neighbourhood had assembled, a chaise and pair dashed up the carriage drive to Forester Hall, and Lawyer Braddon, alighting with the air of a master, thundered at the door. What passed between him and the startled inmates never exactly transpired; but in a day or two the huge mansion was vacated, and every man and boy employed on the estate paid off and discharged. Then the costly furniture and fittings rolled off in waggons to the county town, where the greatest part of it was sold at auction; and a band of workmen from London began dismantling the house. In the course of a few weeks it was razed to the foundations—the shrubberies were cut down, the gardens ploughed up, the noble park disparked, and the whole broad estate cut up into farms, which were subsequently let by tender to the agriculturists of the neighbourhood. Braddon again took up his residence in the county-town, and received the rents and managed the estates for their owner up to the day of his death, and was succeeded in his function by his son, who still retains the office. Martin Forester never returned. There are still two or three surviving of those who witnessed his ignominious punishment, but not one of the whole number ever saw his face afterwards.

TIME AND DEATH.

AN ALLEGORY IN VERSE

"Why run you, Time, so earnestly?"

"Because grim Death rides after me;
I feel his icy breath draw near,
Scorching me with exceeding cold;
And I rush on with eager fear;
—Mad with the agony of fear,
Feeling his loathly presence near,
Mine Enemy of old!"

"How, how thine Enemy, old Time?"

"Still as I run I weave a rhyme
Of cadenced deeds instead of words;
Of flowers, and trees, and voiceful birds;

Of children blithe with laughing eyes;
Of maidens angel-browed and fair;
Of young men strong to do and dare;
I send them forth 'neath summer skies,
But, as in swift pursuit he flies,
Death all my lovely ones despoils,
And kills them with the glare,
The stony glare of his deep-caverned eyes,
Relentless to my prayer."

I watched, and Time still wildly fled,
And round him, stricken down and dead,
The fair forms ever fell away:
And Death pressed on, and nearer drew
Still to his terror-goaded prey.
Till, where Eternity stood in the way,
Death thrust him, that he dying lay.*
And lo! a smile lit up his fading eyes,
For with his upturned fleeting look he knew
That all his treasures in the summer skies
Were gathered, far away from Death:
So in sweet peace his parting breath
With patient smile he drew.

I looked at Death, and saw his brow
Ridged in deep folds of deadly woe:
And from Eternity's calm frown
He shrank aghast, and staggering back
In horrid terror tottered down
Upon his knees, and with a groan,
As of creation overthrown,
† Lay stretched on shrinking earth, a ghastly wrack,
And a wild cry of ecstasy uprose
From earth to heaven, and passed from star to star,
Ceaselessly pealing, till it murmured far
Beyond the eager striving of mine ear,
That in the silence deep seemed still to hear
The sweet melodious ringing of its close.‡

J. R. V.

THE SNOWSTORM AND THE INGLESIDE.

A PERSONAL EXPERIENCE.

BY THE AUTHOR OF "THE HARVEST OF A QUIET EVE," ETC.

THE great fall of snow in January, 1867, is worth recalling, now that winter is again upon us. My parishioners, one and all, assured me that the like, or anything near it, had not been known for just thirty years. And what happens only once in thirty years is an event in lives such as ours. How vividly all the scene comes back to me! I was alone in the east of Kent—wife and child away near London; and, I having accompanied them for the week of the new year, had returned to wind up the affairs of my curacy, from which the death of the rector had removed me. Such sharp cold nights and mornings, at first! such coats piled upon the lonely bed! such a red sun over the pinched fields in the morning! I was busy writing, making up accounts, sallying forth on sick and farewell visits. One morning I rose, and found that there had been a steady snowfall all night. With much writing, etc., on hand, I had before marked this down as a home day; and how strange to look up from my book or my papers, and see all day long the same dizzy, bewildering scene! The impenetrable dun sky, the bare hedge and naked trees, and the great fast-flocking flakes dancing down, without a moment's stay or pause; backwards and forwards, huge clinging feather-flakes, sometimes hurried by a gust, and setting all one way, sometimes leisuredly and loiteringly passing and repassing (it seemed), interlacing and intertwining with each other, until you looked away with tired eyes and confused brain! And thus all day long. Then in the evening post-time came, and I rose from my desk with some letters which must go. The servant, all agog, tells me eagerly how no one has been nor will be near the house,

* Rev. x. 5, 6.

† Rev. xxi. 4.

‡ "Ἐγθεν τὰ πάντα συνεκικέτο, διὰ τὸ μετετάσθαι θανάτου κατάλυσιν."
—Ign. Ep. ad Eph. c. xix. fin.

for such a fall of snow hasn't been seen for years. So I sally forth, and look out amazed upon the scene. While I sat in my study, wrapt in close employment, I took no count of the sum which those many soft white units were composing—much as the spendthrift disregards his fast accumulating total of debt, or the careless sinner the vast aggregate to which those numberless and continual neglects and commissions will have accumulated by the great reckoning day. But now I had emerged from the warm glowing room, and had thrown open the garden gate, and was looking out under the growing night at the strange scene. Not only one white unbroken expanse—hedges, fences, roads blotted out, all the waymarks gone—but seemingly all egress and ingress barred. Such a depth of snow—several feet of sheer even fall—and then the drift against the gate. I peered out and saw in the distance a man wading waist-deep towards the railway, on the other side of which was the post-office. I called to him, but he did not hear, and 'twas hardly fair to call him back; so, nothing else for it, I prepared to wade, striking out far into the field where the other wader had been, far from the path, which was buried under the drift, and so, with pains, to the track down the railway banks; and oh, what a strange scene it was! The huge overhanging avalanches of pure smooth snow, just ready to fall, but falling not, curving over all along into a sharp edge, like a wave just before it breaks; the fantastic shapes, the grace, the purity; then the street on the other side of the railway; the strange appearance, and the strangeness of walking along the narrow trodden track, a false step burying the leg; and from this a sort of miniature chain of Alps sloping up, and overtopping the lost hedge. I was glad that I had been obliged to go out, for the scene was a new one to a stayer-at-home in England; and for some days we had railways blocked up, no post, no bread to be got, nor meat for the Camp hard by. And the drift continued, and piled up the mighty barricades, which then the men (out of work otherwise) cast up by the road-side in great square blocks. I was going about my parish relieving the want, and also saying good-bye; and, as I made new tracks over the hills and away from the impassable and hidden roads, hardly able to look up for the fine sifted snow which drifted into my eyes—the whole country, when I turned to survey it, looking quite different under the keen sparkling star which crested the hill,—I could well fancy how a man might lose his way in the wastes of snow, and, wearied with his wanderings, lack strength at last to struggle out of the drift into which he had fallen, and, with numbed spirit and body, acquiesce in the inevitable death. But with me the period to the day's wanderings was the cheery, comfortable room and meal; the cosy crimson curtains; the firelight dancing on the back of the books; the warm slippers by the hearth; and the society (in my temporary bachelorhood) of some favourite volume invited from the shelf to a *tête-à-tête*; and, over and above these, I hope, a thankful heart. "So let us welcome peaceful evening in." Yet surely not peaceful unless each has done his possible to spread that dancing warm light in other homes where the eyeless socket of a blank grate was staring at the parents and the huddling children in the cruel cold.

The Ingleside—methinks this contrasts pleasantly with the snow-storm. How cheery to come home to it, to remove the snow-caked boots and drift-crust-ed leggings, to coax the soaked socks off the icy feet, and draw on the dry warm hose, within which the numbed toes soon begin to tingle, and anon are in a burning glow! I am

home a little earlier this evening; it is not quite time yet for my solitary meal;

"The freezing blast
That sweeps the bolted shutter,"

shrills, impotently and angrily, missing me. Ah ah, my fine fellow, I am safely housed now; no more straining to-night with red, wet, ice-cold cheeks, and frozen hair, and bent head, and hat pressed tight down, and hands past all feeling, in

"The pelting brunt of the tempestuous night."

I am warm, look you, and dry, do you hear? and cosy, and with some six or seven hours before me of fire glow, and candlelight, and newspaper and books. Ah, you may shriek, and shake the shutter, and swoop round the house, and just stir the heavy crimson curtain; but know, to your utter discomfiture, that you do but make it all the cheerier for me. O, I hug myself when I hear you, with the pleasant sense of a hard day's work done, and a snug evening to be enjoyed. So amuse yourself with heaping up the deep drifts against my door, and fancying that I am your prisoner. I shall be out to battle with you, if I live and am well, in the morning; but to-night I am inside, and you are outside, and I don't mean to alter this state of things. You can run round and round the house, you know, and buffet, and whirr, and scream; I like to hear you; and, as for sending those big soft flakes down the chimney, it may amuse you, and it doesn't hurt me; so much the worse for them, white flakes stained in the sooty descent, and hissing and spitting as they die upon the glowing coals. There I shut the door, and set the shadows dancing with a blaze, and now I needn't leave this warm mellow room till bed-time.

What shall I do: light the lamp? Not yet; there is half an hour to spare before the servant comes in to lay the cloth, and I am tired, and inclined just to sit still and enjoy the firelight.

"The grand debate,
The popular harangue, the tart reply,
The logic, and the wisdom, and the wit,
And the loud laugh—I long to know them all;
I burn to set the imprisoned wranglers free,
And give them voice and utterance once again."

But that shall be presently; the newspaper may still wear its belt of string; I am not ready for it yet.

"Though news-puffed, like the cheeks of Fame,
News, county business, all must bide."

And I will just lean back and meditate here, while the log hisses and the flames flap and flutter. There is much to think of. There are the experiences, interesting, sad, cheering, of the day, the day's news of my little parish-world. There is the pleasant journey (and all without leaving the snug room) to that other fire-side, in my home eighty miles away.

Yes, there was plenty to think about, as I sat here; and the servant seems to have disturbed me too soon. Well can I enter into Cowper's enjoyment of the hour before lamplight, delightful now and then, when one is tired or languid after work. It is pleasant to read what he says:—

"But me, perhaps,
The glowing hearth may satisfy awhile
With faint illumination, that uplifts
The shadows of the ceiling, there by fits
Dancing uncouthly to the quivering flame:
Not undelightful is an hour to me
So spent in parlour twilight: such a gloom
Suits well the thoughtful, or unthinking mind,
The mind contemplative, with some new theme
Pregnant, or indisposed alike to all."

You must read for yourself how he watches and invents the faces in the fire, and the fluttering "sooty

films that play upon the bars;" confessing, "fearless, a soul that does not always think." Then he sums up:—

" 'Tis thus the understanding takes repose
In indolent vacuity of thought,
And sleeps and is refreshed. Meanwhile the face
Conceals the mood lethargic with a mask
Of deep deliberation, as the man
Were tasked to his full strength, absorbed and lost.
Thus oft, reclined at ease, I lose an hour
At evening, till at length the freezing blast
That sweeps the bolted shutter, summons home
The recollected powers; and snapping short
The glassy threads with which the fancy weaves
Her brittle toils, restores me to myself.
How calm is my recess, and how the frost,
Raging abroad, and the rough wind endear
The silence and the warmth enjoyed within."

But now the cloth is laid, and the meal is ready; the lamp is lit, and another phase of the evening begins. I take down a friendly volume, and arrange my small desk on the table; for, be it confessed, I always read at meals when I am alone. Why should the mind fast while the body feasts? And so I sit and eat, while the obliging author whom I have selected tells me all that he has to say; and certainly he somewhat protracts the meal. Alas! I find on turning to the clock, that two hours of my miserly treasured evening have passed. These evenings do always seem so short! if only I could add two or three hours to them there would really be something to go upon. But I must make the most of what I have, and still there is a goodly margin left. The servant has cleared away now; the door is shut; I draw chair and table (little Oxford coffee-table) near the fire, and settle down to a good quiet steady read—a rare treat this to

one whose life, unlike that of the regular student's, is busy, and always liable to interruptions. Fast-fleeting hours! how soon they have fled! and the bell is rung for prayers; and then bed-time soon comes, and mine enemy, the wind, seems somehow to have got into the house, and to be waiting on those stairs. Has the bedroom been iced? But soon I am intrenched again, warm all over, except for a frozen nose outside the pile of blankets and clothes. And the snow-flakes twine and contend outside, and cake the windows, and the freezing blast winnows the blank white fields, and drives the sparkling dust of sifted snow in neck-deep slopes against every impediment. And the dead, ruddy coals silently fall under the grate, and the faint flutters die out, and the glow fades into dust, and the ingleside sleeps, and I hope we shall both wake fresh, and fervent, and sparkling, for our work in the morning.

How sweet is rest after work! Ay, and I heard a hale man echo, How sweet is work after rest! In the Book of Malachi there is a threat to the Jews, that God would curse their blessings. Truly may we not say that he reverses this to those who obey and love him, and blesses our curses? There is surely a happiness in honest work, and a blessing upon the earning our bread with the sweat of the brow, if this be earned and eaten to the glory of God. And Death—"the sharpest arrow of the Almighty's store"—where is its sting? The soul only passes to its long sweet rest after the day's labour; and like soft snow from heaven comes God's gift of sleep to the weary body, to keep it safely until the glad summons of the everlasting spring.

NIL ACTUM CREDENS DUM QUID SUPERESSET AGENDUM.—*Lucan.*
